## Consumption guidelines for fish caught by anglers

| Consumption Frequency | | |  | | |
|---|---|---|---|---|---|
| Long-term consumption | No restrictions | 0.2 kg/wk (0.5 lb /wk.) | 0.1 kg/wk (0.3 lb /wk.) | 1 or 2 meals per month 0.5 kg/mo (1 lb /mo.) | None |
| One-week vacation | No restrictions | 10 meals 2.3 kg (5 lb.) | 7 meals 1.5 kg (3 lb.) | 1 or 2 meals 0.5 kg (1 lb.) | None |
| Two-week vacation | No restrictions | 5 meals per wk 1.3 kg/wk (2.8 lb /wk.) | 4 meals per wk 0.8 kg/wk (1.9 lb /wk.) | 1 or 2 meals/wk 0.5 kg/wk (1 lb /wk.) | None |
| Three-week vacation | No restrictions | 4 meals per wk 1 kg/wk (2.1 lb /wk.) | 3 meals per wk 0.6 kg/wk (1.4 lb /wk.) | 1 or 2 meals/wk 0.5 kg/wk (1 lb /wk.) | None |

**Children under 15 and women of childbearing age should eat only fish in category.**

## Contaminants analysed

The number identifies the contaminant or group of contaminants for which the fish was tested:

1 Mercury
2 Mercury, PCBs, mirex and pesticides
3 PCBs, mirex and pesticides
4 Mercury, PCBs and mirex
5 Mercury, other metals, PCBs, mirex and pesticides
6 Mercury, other metals
7 2,3,7,8-TCDD (dioxin)
8 Toxaphene

**Key to using the guide tables on page 2.**
**Location index on page 144.**

# Preface

The *Guide to Eating Ontario Sport Fish* provides anglers and consumers with up-to-date information on recommended levels of consumption of sport and game fish from lakes and rivers throughout Ontario and many locations on the Great Lakes and their connecting channels.

The guide is revised annually and is the product of the combined efforts of technicians, analysts, scientists and medical specialists of the Ontario Ministry of the Environment, Ministry of Natural Resources and Ministry of Labour.

This 14th edition of the guide provides fish consumption advice for over 1700 locations across the province and contains the best available information up to the end of February 1990. An index to locations is provided at the back of the tables.

Fish are collected by staff of the Ministry of Natural Resources and are then sent to Ministry of the Environment laboratories where they are analysed for a variety of substances including mercury, PCBs, mirex and DDT. The results are used to develop the tables published in this guide which give size-specific consumption advice for each species tested from each location. The consumption advice is based on federal government health protection guidelines.

Fish collection and testing is a continuing program. Available resources are balanced between testing new lakes and rivers and retesting those locations where changes in contaminant levels may be occurring. By testing the same fish species at the same location over a period of many years, scientists can determine trends in the levels of certain contaminants in those species. In some cases the data can be used to pinpoint sources of pollution so that action can be taken to control these discharges.

To report occurrences of pollution or fish kills, contact the nearest office of the Ministry of the Environment listed in the Addresses section of this book.

Anyone requiring information on angling regulations, limits of catch or open seasons should obtain a copy of the publication *Ontario Sport Fishing Regulations* which is available from any office of the Ministry of Natural Resources listed in the Addresses section.

To obtain detailed data for a specific location tested under the sport fish contaminant monitoring program or further information on the results in this and previous guides, contact:

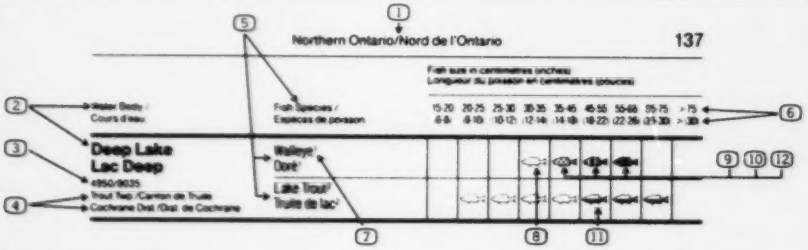
# Key to using the guide tables

The guide tables provide sport fish consumption advice based on the level of contaminants found in fish according to their species, length and location.

Please note that laboratory analyses are carried out on the lean, dorsal, skinless, boneless muscle tissue of the fish and the consumption guidelines are based on the results from this portion. Other parts of the fish – the whole fish, fish steaks or belly fat – may contain higher concentrations of organic contaminants such as PCBs, mirex, DDT or 2,3,7,8-TCDD as these contaminants are attracted to fatty tissue. It is therefore recommended that only skinless, boneless fillets of these fish be consumed.

The water body names and locations were obtained from the *Gazetteer of Canada (Ontario)*. The location description includes latitude and longitude, enabling anglers to use the Ontario *Official Road Map* (which has latitudes and longitudes in the margin) to determine the general location of the body of water; larger scale topographical maps can then be used to pinpoint the location. An alphabetical listing of all locations tested is contained in the index.

The following is a key to the various components of the tables, using a simulated example called Deep Lake.



## Location identifiers

① The tables are divided into three sections by region: southern Ontario, Northern Ontario and the Great Lakes, as noted at the top of each page.

② The name of the location sampled

③ The latitude and longitude of the location

④ The township, county or territorial district of the location

## Fish species tested

⑤ The species tested are usually those species that are most likely to indicate elevated levels of contaminants (see the section entitled Selection of fish species for testing).

## Fish length

⑥ The total length of the fish is measured, from the tip of the nose to the tip of the tail. The fish length is expressed in the tables in both centimetres and, in brackets, inches.

## Contaminants analysed

⑦ The number identifies the contaminant or group of contaminants for which the fish was tested:

1 Mercury
2 Mercury, PCBs, mirex and pesticides
3 PCBs, mirex and pesticides
4 Mercury, PCBs and mirex
5 Mercury, other metals, PCBs, mirex and pesticides
6 Mercury, other metals
7 2,3,7,8-TCDD (dioxin)
8 Toxaphene

The fact that fish were tested for a particular group of contaminants does not mean that the fish will contain all of these contaminants–for example, fish analysed for contaminant group 4 may contain only mercury and not PCBs or mirex.

In a number of locations, fish are analysed only for mercury as this is likely to be the only contaminant to cause consumption restrictions.

## Fish consumption symbols

### Unrestricted consumption

⑧ This is the only category of fish that is suitable for consumption by women of childbearing age (pregnant women, women intending to become pregnant or breastfeeding mothers) and children under 15.
No substances tested were found at levels which would cause fish consumption to be restricted.

### Restricted consumption

⑨ Consumption of these fish is restricted, based on mercury levels between 0.5 and 1.0 parts per million.

⑩ Consumption of these fish is further restricted, based on mercury levels between 1.0 and 1.5 parts per million.

⑪ Consumption of these fish is restricted, based on the presence of one or more industrial organic contaminants, such as PCBs or mirex, at levels above federal guidelines.

### No consumption

⑫ None of these fish should be consumed, based on mercury levels above the 1.5-parts-per-million federal guideline.

## Consumption guidelines

The table below presents the maximum recommended consumption of Ontario sport fish according to their contaminant content and frequency of consumption.

Many anglers in Ontario catch and consume fish throughout the year: these people are considered to be long-term consumers and should consult the long-term consumption category on the table below. However, some anglers only catch and consume fish on an annual fishing vacation: these people should select the appropriate one-week, two-week or three-week category.

The maximum consumption quantities are given in number of meals and total weight per week. A meal consists of 230 g (0.5 lb.). Please note that women of childbearing age and children under 15 should only eat fish in the ⑧ category.

**Consumption guidelines for fish caught by anglers**

| Consumption Frequency | ⑧ | ⑨ | ⑩ | ⑪ | ⑫ |
|---|---|---|---|---|---|
| Long-term consumption | No restrictions | 0.2 kg/wk. (0.5 lb./wk.) | 0.1 kg/wk. (0.3 lb./wk.) | 1 or 2 meals per month 0.5 kg/mo. (1 lb./mo.) | None |
| One-week vacation | No restrictions | 10 meals 2.3 kg (5 lb.) | 7 meals 1.5 kg (3 lb.) | 1 or 2 meals 0.5 kg (1 lb.) | None |
| Two-week vacation | No restrictions | 5 meals per wk. 1.3 kg/wk. (2.8 lb./wk.) | 4 meals per wk. 0.8 kg/wk. (1.9 lb./wk.) | 1 or 2 meals/wk. 0.5 kg/wk. (1 lb./wk.) | None |
| Three-week vacation | No restrictions | 4 meals per wk. 1 kg/wk. (2.1 lb./wk.) | 3 meals per wk. 0.6 kg/wk. (1.4 lb./wk.) | 1 or 2 meals/wk. 0.5 kg/wk. (1 lb./wk.) | None |

**Children under 15 and women of childbearing age should eat only fish in ⑧ category.**

Example:
An angler on a three-week fishing vacation catches a 40-cm (16-inch) walleye from Deep Lake and wants to determine the suitability of that fish for consumption. The angler should:

- Find Deep Lake in the guide tables:

- Note that the symbol given for walleye in the 35- to 45-cm (14- to 18-in.) range is .
- As the symbol is not , the angler knows immediately that the fish is not suitable for consumption by women of childbearing age and children under 15.
- If the consumer is not a woman of childbearing age or a child under 15, consult the three-week per year category in the consumption guidelines table on the inside front cover. This shows that the recommended maximum consumption is four meals, or one kilogram, per week.

# The sport fish contaminant monitoring program

## Selection of locations for testing

With over 250,000 lakes, innumerable rivers and streams and many local areas in the Great Lakes, it would not be practical or economical to test fish from every water body.

A location may be selected for testing for one or more of the following reasons:

- It is a popular angling area.
- There is a known or suspected source of pollution nearby.
- It is a major source of food for local inhabitants (usually lakes in the vicinity of Indian reserves).
- It is being opened for recreational development.
- It is part of a monitoring program for long-term studies of contaminants in fish.

The selection of testing sites is an ongoing process and public input is welcomed.

## Selection of fish species for testing

Most lakes and rivers contain a variety of fish species. When selecting appropriate species for contaminant testing, the fact that not all species accumulate a particular contaminant at the same rate has to be taken into account.

Therefore, one kind of fish of a certain size may have a much lower contaminant concentration than another species of the same size. This is due to the fact that different fish feed on different things, prefer different habitats, grow at different rates and are physiologically different.

For example, walleye (yellow pickerel) and northern pike are likely to contain higher levels of mercury than whitefish of the same size since walleye and pike are top predators, feeding on smaller fish which may also contain elevated mercury levels.

Whitefish, on the other hand, feed lower down in the food chain, on aquatic insects and invertebrates which contain less mercury than do small fish.

Therefore, when testing fish for mercury in a specific area, the practice is initially to select those species which are top predators, as they will indicate the highest mercury levels likely to be found. If low levels of mercury are found in predators, the testing of other species may not be necessary.

In testing for organic contaminants such as PCBs and mirex, species with high fat levels, such as salmon, lake trout, smelt and perch, are selected since organic chemicals usually tend to accumulate in fatty tissue.

Again, if these species do not contain excessive levels of organic contaminants, then less fatty species from the same location may not have to be tested.

## Collection of fish for testing

Most fish are collected by Ministry of Natural Resources staff using various netting methods. Whenever possible, the selection includes 20 fish of each species with lengths and weights representative of the size range of that species in the locations being tested. The length, weight and sex of each fish collected are recorded. A boneless, skinless fillet of dorsal muscle flesh is removed from the fish (see illustration), packaged and frozen for shipment to Ministry of the Environment laboratories in Toronto or Thunder Bay.

## Retesting of locations

Since the mid-1970s the sport fish contaminant monitoring program has added, on average, 100 new locations each year, bringing the total number of sites tested to over 1,700.

As well as adding new locations, the program incorporates into its schedule the retesting of lakes and rivers where this is warranted. In areas remote from human activity, where fish are relatively unaffected by pollution, any consumption restrictions are usually limited to elevated mercury levels in the larger and older predatory species such as walleye and northern pike. The source of mercury in these areas is largely natural and does not change much over time: therefore, concentrations in fish do not change substantially.

However, in areas affected by human sources of pollution, the number of possible contaminants may be much larger and the levels found in fish can be significantly affected by changes in the levels of pollution.

Retesting locations are divided into three general groups:

- Areas where contaminant levels for one or more pollutants are either unusually elevated or change substantially. These locations are retested every one to three years, depending on their angling popularity or whether they are a major food source for local inhabitants.
- Areas which show no signs of substantial changes in contaminant levels but which are very popular angling areas. These locations are retested at least every five years.
- All other areas - usually relatively remote locations with no major sources of pollution nearby and no indication of changing contaminant levels in fish. These locations are retested as available resources permit, approximately every 10 years.

## Testing of fish

A boneless, skinless dorsal fillet sample not only provides the most consistent test results, but is also the best edible portion of most sport fish.

Please note that only the boneless, skinless dorsal fillet should be consumed when the fish is found to contain organic contaminants such as PCBs and mirex.

The fish tissue is analysed for contaminants at the Ministry of the Environment's laboratories using a variety of methods depending on the particular contaminant.

## Preserving and preparing your fish for cooking

If you decide to keep and eat your catch, you should keep it in the best possible condition until it reaches the table. Freshly caught fish should be chilled on ice or in a refrigerator as soon as possible to avoid spoilage. Then, at the earliest opportunity, the fish should be cleaned, dressed and refrigerated or preserved for future use.

The following is one of the procedures commonly used for gutting, filleting and skinning fish:

- Slit open the belly from the vent (anal opening) forward to the head and remove the internal organs.
- Trim away the head and fins.
- Lay the fish on its side on a cutting board. With a thin sharp knife, cut through the skin and flesh just behind the head down to the backbone. Turn the knife blade along the backbone and, with a sawing motion of the blade, follow the backbone down to the tail, keeping as close to the backbone as possible.
- Repeat for the fillet on the other side of the fish.
- Laying each fillet skin-side down on the board, remove the rib bones by inserting the knife blade just under the ribs and separating them from the fillet with as little flesh left on them as possible. Trim away the pelvic fin and any belly fat from the ventral portion of the fillet.
- Lay the fillets skin-side down and, starting at the tail with the knife blade parallel to the skin and as close to it as possible, slice forward with a sawing motion to separate the skin from the fillet.

You are then left with skinless, boneless fillets. Wash in clean cold water and cook, refrigerate, freeze or preserve as desired.

## How to release fish

A number of anglers fish for the "thrill of the catch", and release their fish to allow them to be caught again. If you decide not to keep a particular fish, here are some tips to apply to safely return the fish to the water:

1. Time is essential, so quickly play and release the fish. A fish played for too long will be too exhausted to recover. A fish hooked in deep water should be brought up slowly to prevent stress due to pressure and temperature changes.

2. Keep the fish in the water as much as possible, since fish out of water will suffocate. Do not allow the fish to flop on the ground or on the rocks. Just a few inches of water under a thrashing fish will act as a protective cushion.

3. Gentle handling of the fish is essential, and hands should be kept wet at all times while handling any fish. Do not put your fingers in the gills or in the eye sockets. Small fish should not be squeezed but should only be lifted by the lower lip. A net is helpful while handling fish, but keep it in the water.

4. Remove hooks quickly using longnosed pliers. If the fish is deeply hooked, cut the line and leave the hook in, as it will dissolve and will not harm the fish. Do not try to tear out hooks.

5. To revive an unconscious fish, hold it upright in the water heading upstream (if there is a current). Apply artificial respiration by moving the fish forward and backward so that water runs through the gills. It may take a few minutes for the fish to revive. When the fish does begin to struggle, release it.

## Parasites of fish

Anglers sometimes catch fish which contain worms, grubs, cysts or nodules in the flesh. When cleaning fish, anglers may notice worms in or around the intestines of the fish or fungus growths on the skin, fins or gills. These parasites of fish are a normal part of the ecosystem in which the fish lives. While not esthetically pleasing, the edible portions

containing parasites, if properly and thoroughly cooked, do not present a health hazard.

Some of the most commonly seen parasites associated with fish are black spot in bass and yellow perch, yellow grubs, leeches, lamprey, fish lice and gill flukes.

## Tumors in fish

Occasionally, anglers catch fish with external growths, tumors, sores or other lesions. Such abnormalities generally result from viral or bacterial infections. Abnormalities in the liver or intestine are sometimes seen in coarse fish such as white suckers and brown bullheads, and can be caused by parasites or tumors. Concern about the potential effects of these diseases on the fish themselves and the possible role of pollution in causing tumors in some coarse fish has prompted ongoing investigations into these abnormalities. Growths on game fish caused by viruses include lymphocystis, dermal sarcoma and lymphosarcoma.

Lymphocystis, a viral disease affecting walleye and perch, is common throughout Canada. Viruses infect the fish's skin through contact with infected fish during the spring spawning run, forming pale or white cauliflower-like growths. Lymphocystis does not kill affected fish, and tagging studies have shown that these fish can lose the growths by the following spring. There is no known health risk from consuming an infected fish once it has been skinned and cooked.

Dermal sarcoma, another viral disease affecting walleye, is caused by viruses which infect cells and cause growths just under the skin. These growths can be removed by skinning the fish.

Lymphosarcoma is a viral disease affecting muskellunge and northern pike. This virus is transmitted at spawning, but the lesions caused by it can vary depending on the season and stage of the disease. In the spring, affected fish have thick white patches on their skin from which viruses are shed and these in turn infect other fish. Later in the year these patches may heal, forming blotchy red sores or even normal skin. The virus causing lymphosarcoma infects the white blood cells of the fish and can spread throughout the body during the summer or over several years. This disease can kill infected fish, but there is no evidence to suggest that it is a human health hazard.

Coarse fish in various parts of the Great Lakes have been found to have lip and skin growths similar to human warts in appearance. Growths on coarse fish kept in the laboratory often disappear and new ones can develop very quickly, suggesting that viruses likely cause these tumors as well.

Studies on Canadian and American areas of the Great Lakes have found an increased rate of lip and skin growths on coarse fish captured in polluted areas; in some extremely polluted areas, liver and intestinal tumors have been found in these fish. Studies suggest that pollution may cause the liver tumors and may indirectly cause skin growths–the warmer water in polluted areas attracts larger numbers of fish, thus increasing their risk of becoming infected with viruses. Considerable research, much of it being conducted or funded by the Ontario and Canadian governments, is being undertaken to determine whether pollution is a cause of these tumors.

The appearance of viral or bacterial infections in fish may be unsightly, but there is no evidence to suggest that these infections pose a threat to consumers of infected fish.

# Contaminants in fish

There are many naturally occurring substances, such as mercury which, at levels normally found in air, water and food, pose no hazard to the environment or to human health. A number of synthetic substances, such as PCBs, mirex and dioxin, may also be found in the environment. When the level of these substances exceeds government guidelines or objectives, then these substances can be called contaminants or pollutants.

The following section describes the broad range of substances which may be tested for in Ontario sport fish. For more information on these substances and their health implications, please contact the office of the sport fish contaminant monitoring program.

## Inorganic substances

### Mercury

Mercury is a naturally occurring metal which is found in very low levels in air, water, rocks, soil and plant and animal matter.

At one time mercury was widely used in industry; however, government and industry took action in the late 1960s and early 1970s and mercury discharges from major industrial sources have been virtually eliminated. Relatively small amounts of mercury are still used, but there is no evidence that these limited uses have led to serious environmental problems.

Mercury is attracted to particles in the water and settles to the bottom sediments where it can be converted by micro-organisms into methylmercury. Methylmercury is rapidly absorbed by a fish, either directly from water passing over its gills or ingested with the organisms which form its diet. Since fish eliminate mercury at a very slow rate, concentrations of this substance gradually accumulate.

The consumption guidelines developed for use by Ontario anglers are based on federal guidelines supplemented by recommendations from the World Health Organization and supported by medical evidence gained through the study of methylmercury poisoning epidemics in Japan and Iraq.

### Other metals

Copper, nickel, zinc, cadmium, manganese, chromium, arsenic and selenium are sometimes found in fish tissue but not at levels which would suggest a need for consumption restrictions.

Elevated levels of lead were detected in fish collected downstream from a tetraethyl lead manufacturing plant on the St. Lawrence River in 1983. Since this plant was shut down in 1985, lead levels have declined and lead is no longer a contaminant of concern.

## Industrial organics

### Polychlorinated biphenyls (PCBs)

PCBs are a group of chlorinated organic compounds first commercially developed in the late 1920s. They are not formed naturally in the environment, so their presence can always be attributed to human activity.

PCBs tend to persist for years in the natural environment. This, coupled with the fact that they bioaccumulate readily in the aquatic ecosystem, has meant that top predator species of fish with a high fat content (for example, salmon and trout) have, in some Ontario waters, accumulated PCBs to contaminating levels. PCBs have been banned in all new products and are now only found as an insulating fluid in existing closed electrical power transformers and capacitors. Strict regulations for the storage and disposal of PCBs and PCB-contaminated equipment minimize the chance of further releases of PCBs

into the environment and have resulted in declining levels of PCBs in the aquatic environment. The consumption advice provided in this guide for sport fish containing PCBs is based on the federal guideline of 2.0 parts per million for the sale of commercial fish.

### Mirex

Mirex is a chlorinated carbon compound used as a pesticide in the southern United States but never registered for such use in Canada.

Mirex has been detected in fish primarily from Lake Ontario. The sources were found to be a former processor of mirex in Niagara Falls, New York and a manufacturing plant in Oswego, New York. The behaviour of mirex in the aquatic environment is similar to that of PCBs in that it remains in the environment for a long time and has a high affinity for fats. The consumption advice provided in this guide for sport fish containing mirex is based on the federal guideline of 0.1 parts per million for the sale of commercial fish.

## Pesticides

### DDT

DDT, which was developed during the Second World War, gained widespread use as an insecticide for agricultural and public health purposes. DDT, like PCBs and mirex, is only slowly broken down in the natural environment.

However, levels of this substance in fish flesh have declined in the two decades since the use of DDT was severely restricted, and today there are no consumption restrictions due to DDT levels.

### Toxaphene

Toxaphene is an insecticide that is extremely persistent in the aquatic environment. It was removed from general use in Canada in 1974 and restricted in the United States in 1982.

It is found occasionally in fish from Ontario waters, but concentrations are well below levels of concern.

### Other pesticides

As part of the sport fish contaminant monitoring program, a number of pesticides used widely in the past throughout North America are routinely analysed. These substances are HCB (hexachlorobenzene) and the pesticides lindane, heptachlor, aldrin and chlordane. At sampling locations in Ontario they have not been detected at levels which would require any restrictions on the consumption of fish.

## New substances

The sport fish contaminant monitoring program monitors as many substances as practically possible. As methods become available to measure low levels of chemicals in fish, they are added to the battery of tests available.

Procedures for incorporating a range of chlorinated phenols, chlorinated benzenes and polynuclear aromatic hydrocarbons have recently been added. To date, these substances have been found occasionally in fish, but at very low levels that would not affect consumption.

The Ministry of the Environment is currently developing procedures to measure extremely low levels of the family of substances called dioxins and furans, with the aim of measuring the most hazardous of these. Some test results for the most toxic of these substances - 2,3,7,8-TCDD - are already included in the tables.

## Trends in contaminant levels

The persistence of contaminants in the aquatic environment varies from substance to substance. The breakdown or transformation of contaminants into forms that are inactive or less toxic may take anywhere from minutes to years. With more persistent substances, such as PCBs, it takes many years of collecting and assessing data for trends to become clear.

The data collected from long-term monitoring through the sport fish contaminant monitoring program is particularly effective in assessing trends in contaminant levels over time.

One such trend is the decline over time in the level of a contaminant in fish once the source of that contaminant has been restricted or eliminated.

For example, sport fish from lakes on the English-Wabigoon River system were affected by mercury discharges into the system in the 1960s and early 1970s from a chlor-alkali plant near Dryden. As a result of control actions, the mercury levels have declined to much lower levels than the levels in the early 1970s. Sport fish have been annually monitored from several lakes in the system, including Clay, Ball and Tetu. The decline in mercury levels in the edible portion of walleye from Clay Lake, which is the lake monitored closest to the source, is shown in Figure 1. Figure 2 shows the decline in mercury levels in walleye in 1987 for Clay, Ball and Tetu Lakes which are progressively further away from the previous contamination source.

Data from the sport fish contaminant monitoring program can also be used to show the variation in contaminant levels in a sport fish species from various locations. Two examples of this are the variation in mercury levels in walleye from three natural systems, and the variation in PCB levels in chinook salmon from four Great Lakes locations.

Mercury is a naturally occurring element which has been found in fish everywhere in the province. Figure 3 shows the wide variety of naturally occurring mercury levels in the edible portion of walleye from three natural systems in Ontario (ie. systems unaffected by mercury discharges). These differences in mercury levels stem from differences in physical and biological conditions within the waterbodies.

PCBs are usually found in highest concentrations in fish sampled from Great Lakes locations, particularly Lake Ontario locations. Figure 4 shows the differences in PCB levels with fish length for the edible portion of chinook salmon from four Great Lakes locations. Only the chinook salmon from Lake Ontario exceeded the 2.0 parts per million federal government guideline for unlimited consumption.

**Results of the 1989 guide questionnaire**

A mail-in questionnaire was enclosed in 100,000 copies of the Guide, and 913 responses were tabulated. These questionnaires, which are produced every three years, are used to determine the effectiveness of the Guide as a fish consumption advisory. Information is also obtained regarding the amount and frequency of fish consumption, the preferred fishing locations and the species caught and consumed. Respondents are also given the opportunity to suggest future sampling locations, and to make comments and suggestions on the Guide and the program.

This section discusses some of the quantified results and some of the suggestions which were received in the questionnaire comments.

The principal results were:

1. Almost 75% of the respondents had used the Guides in previous years.

2. Over 75% of the respondents indicated that their fishing and/or fish-consuming habits had changed after using the Guide (as well, the majority of those responding "no" indicated that it was because they don't eat fish, don't catch or eat enough fish, the areas fished were not listed in the Guide, or the fish caught were in the unlimited consumption category).

3. Over 75% of the respondents indicated that the Guide met their needs and listed all or most of the waterbodies they were interested in.

4. Almost 90% of the respondents indicated that they found the new text at the beginning of the Guide useful and informative.

5. The most frequently fished location was Lake Ontario, while Lake Simcoe was the most frequently fished inland lake, and the Credit River was the most frequently fished river. Table 1 lists the ten most commonly mentioned bodies of water in three categories: the ten most popular angling areas, the inland lakes and rivers. The relative frequency of each of these is given (ie. the frequency that each one was mentioned, based only on the top 10 results) so that the total is 100%.

6. Over 60% of the respondents fished once every two weeks, or more frequently.

7. Walleye was the most frequently caught and consumed sport fish species (two-thirds of the respondents who consumed fish ate one or more meals of walleye). Other warm-water species, such as smallmouth bass, yellow perch and northern pike were also frequently consumed. Table 2 lists the ten most frequently caught and consumed sport fish species and the % relative frequency is given (similar to Table 1).

8. The average size of a sport fish meal consumed by anglers was 272 gm (9.6 oz). The most common frequency for consuming sport fish was once a month.

9. The average commercially purchased fish meal consumed by anglers was 224 gm (7.9 oz) and the most common frequency of consumption was once a month. Saltwater species such as haddock and cod were consumed much more frequently than the freshwater commercial species.

The questionnaire respondents were given the opportunity to comment on several questions, and many useful suggestions and comments were received. Some of the suggestions which were received in previous questionnaires were incorporated into the Guide, and the public input is welcomed.

The most frequent request among the suggestions for improvement of the Guide was for more waterbodies and more species to be tested. Other common suggestions included larger print size, better paper, coloured fish pictures, more maps and a catch and release section. Each of these suggestions is discussed in the following sections.

**1. More sampling of waterbodies and fish species**

An explanation of the reasons for the selection of a particular location for sampling is given in "Selection of locations for testing" on page 4. A list has been made of the requests for sites to be sampled, and this will be considered when future sampling site selections are made.

It is neither economically feasible nor necessary to test all fish species in a particular waterbody. For a full explanation of the selection of fish species for testing, see page 4.

**2. Larger print size**

A smaller print size was used in the 1989 Guide to reduce the number of pages, as part of an overall format change to reduce the cost of producing the Guide. However, because of a number of comments, the print size will be enlarged.

**3. Paper quality**

The Guide was printed on recycled paper as a conservation practice. As well, this is a cost-saving factor which enables a greater number of Guides to be printed.

**4. Coloured fish pictures**

Coloured pictures of Ontario sport fish are provided in a poster distributed by the Ministry of Natural Resources. For cost reasons, it was decided to retain the black and white illustrations. As well, the colourations of some species vary somewhat between locations. However, many of the illustrations have been improved through the artistic efforts of University of Guelph student Rebecca Brebner.

**5. Maps**

Page size limitations do not allow for the inclusion of maps on a reasonable scale. However, readers can make use of the Ontario road map and Canadian Government topographical maps. Margins of these maps have latitude and longitude values which can enable readers to locate each waterbody in the Guide using the latitude and longitude given under the location name.

**6. Catch and Release**

Because of the number of suggestions, as well as the increasing popularity of "fishing for sport", a catch and release section has again been included in the Guide text.

A detailed report on the results of the 1989 questionnaire may be obtained by written request to:

Sport Fish Contaminant Monitoring Program
Questionnaire Report

**Table 1**
**Relative popularity of the most frequently fished lakes and rivers in the 1989 survey.**

| Lake/River | Relative Popularity (%) |
|---|---|
| a) Ten Most Popular Angling Areas | |
| 1. Lake Ontario | 19.5 |
| 2. Lake Huron/Georgian Bay | 19.3 |
| 3. Lake Erie | 13.5 |
| 4. Lake Simcoe | 10.0 |
| 5. Credit River | 7.1 |
| 6. Grand River | 6.9 |
| 7. Trent River | 6.5 |
| 8. Lake Scugog | 6.4 |
| 9. Lake Nipissing | 5.8 |
| 10. Saugeen River | 5.0 |
| | 100.0 |
| b) Inland Lakes | |
| 1. Lake Simcoe | 23.9 |
| 2. Lake Scugog | 15.3 |
| 3. Lake Nipissing | 13.7 |
| 4. Rice Lake | 11.7 |
| 5. Buckhorn Lake | 9.8 |
| 6. Pigeon Lake | 7.6 |
| 7. Balsam Lake | 6.3 |
| 8. Sturgeon Lake | 5.8 |
| 9. Stony Lake | 4.5 |
| 10. Chemung Lake | 1.4 |
| | 100.0 |
| c) Rivers | |
| 1. Credit River | 13.6 |
| 2. Grand River | 13.3 |
| 3. Trent River | 12.4 |
| 4. Saugeen River | 9.7 |
| 5. Ottawa River | 9.5 |
| 6. Thames River | 9.3 |
| 7. French River | 8.6 |
| 8. Ganaraska River | 8.3 |
| 9. Niagara River | 7.7 |
| 10. Rideau River | 7.6 |
| | 100.0 |

**Table 2**
**Relative popularity of the ten most frequently caught and consumed sport fish species.**

| Species | Relative Popularity (%) |
|---|---|
| 1. Walleye | 18.7 |
| 2. Smallmouth Bass | 15.9 |
| 3. Yellow Perch | 12.1 |
| 4. Northern Pike | 11.2 |
| 5. Largemouth Bass | 9.7 |
| 6. Rainbow Trout | 9.2 |
| 7. Lake Trout | 7.8 |
| 8. Brook Trout | 6.1 |
| 9. Chinook Salmon | 4.9 |
| 10. Coho Salmon | 4.4 |
| | 100.0 |

## (Upper) Niagara River / Rivière Niagara (tronçon sup.)

**Fort Erie**
4264/7886
Niagara R.M./Mun. rég. de Niagara

- Rainbow Smelt[2 8] / Éperlan arc-en-ciel[2 8]
- Freshwater Drum[8] / Malachigan[8]
- Yellow Perch[8] / Perchaude[8]
- Rock Bass[8] / Crapet de roche[8]
- White Bass[8] / Bar blanc[8]
- Smallmouth Bass[8] / Achigan à petite bouche[8]
- Rainbow Trout[8] / Truite arc-en-ciel[8]
- Redhorse Sucker[1] / Suceur rouge[1]

**Miller Creek/Ruisseau Miller**
4256/7857
Niagara R.M./Mun. rég. de Niagara

- Smallmouth Bass[8 7] / Achigan à petite bouche[8 7]
- Yellow Perch[2 7] / Perchaude[2 7]
- White Sucker[2 7] / Meunier noir[2 7]
- Rainbow Trout[2 7] / Truite arc-en-ciel[2 7]

**between Fort Erie & Dufferin Island / entre Fort Erie et l'île Dufferin**
4300/7902
Niagara R.M./Mun. rég. de Niagara

- Yellow Perch[8 8] / Perchaude[8 8]
- Rainbow Trout[8 8] / Truite arc-en-ciel[8 8]
- White Sucker[8 8] / Meunier noir[8 8]

## (Lower) Niagara River / Rivière Niagara (tronçon inf.)

**Queenston-Whirlpool**
4307/7904
Niagara R.M./Mun. rég. de Niagara

- American Eel[8 7] / Anguille d'Amérique[8 7]
- Rainbow Trout[8 7 8] / Truite arc-en-ciel[8 7 8]
- Yellow Perch[8 7 8] / Perchaude[8 7 8]
- Walleye[7] / Doré[7]

*Continued top right / Suite colonne de droite*

**Jordan Harbour to Port Weller / Du havre Jordan à Port Weller**
4312/7919
Niagara R.M./Mun. rég. de Niagara

- Brown Trout[8 7 8] / Truite brune[8 7 8]
- White Bass[2 7 8] / Bar blanc[2 7 8]
- Brown Bullhead[2 8] / Barbotte brune[2 8]
- Gizzard Shad[2] / Alose à gésier[2]
- Yellow Perch[2] / Perchaude[2]
- Channel Catfish[2 8] / Barbue de rivière[2 8]
- Coho[2 7 8] / Saumon coho[2 7 8]
- Lake Trout[2 7 8] / Truite de lac[2 7 8]
- Rainbow Trout[2 7 8] / Truite arc-en-ciel[2 7 8]
- Freshwater Drum[2 8] / Malachigan[2 8]
- Carp[2 8] / Carpe[2 8]
- Northern Pike[2 8] / Brochet[2 8]
- Rainbow Smelt[8 8] / Éperlan arc-en-ciel[8 8]
- White Perch[2 8] / Bar-perche[2 8]

**Burlington Bay, Hamilton Harbour / Baie Burlington, Port d'Hamilton**
4317/7950
Hamilton-Wentworth R.M. / Mun. rég. d'Hamilton-Wentworth

- Rainbow Smelt[8] / Éperlan arc-en-ciel[8]
- White Perch[8 8] / Bar-perche[8 8]
- Brown Bullhead[8] / Barbotte brune[8]
- Carp[8] / Carpe[8]
- Northern Pike[8] / Brochet[8]
- Black Crappie[8] / Marigane noire[8]

# Location Index
# Index des emplacements

This index not only lists the page numbers for all of the locations listed in this guide, but also provides a cross-index of lakes with more than one local name. The location names are lakes unless otherwise indicated (e.g. Abitibi R. is Abitibi River). Where there is more than one waterbody with the same name, the county or district where each waterbody is located is indicated in brackets beside the name (e.g. Bark (Renfrew)). As well, where there is more than one location sampled for the same waterbody, the total number of locations is indicated in brackets (e.g. Abitibi R. (6)).

L'index donne, en plus du numéro de page où l'on peut trouver les divers emplacements figurant dans ce guide, un index croisé des cours d'eau connus sous plusieurs noms. Les noms d'emplacements se rapportent aux lacs, sauf indications contraires (p. ex. Abitibi R. signifie rivière Abitibi). Lorsque le même nom désigne plus d'un cours d'eau, le comté ou le district où se trouve chaque cours d'eau est donné entre parenthèses (p. ex. Bark (Renfrew)). De même, lorsque plus d'un emplacement est donné pour le même cours d'eau, on donne le nombre total d'emplacements entre parenthèses (p. ex. Abitibi R. (6)).

# Fish Identification
# Identification des poissons

The consumption advice provided in this book is related to specific species of fish and, in order to use the information properly, it is important to correctly identify the species of fish caught.

Such identification usually presents no problem to the dedicated angler, but people new to the sport may sometimes have a bit of trouble determining the type of fish that they have caught and wish to eat.

On the following pages are sketches of the types of the fish most commonly sought in Ontario. Accompanying each picture is a brief description of the length and weight ranges of adult fish that anglers are likely to catch from Ontario's lakes and streams. For those fishermen lucky enough to land a "lunker", the record size of many species are provided for comparison.

Information on the distribution (D), spawning time (S) and food consumed (F) is also provided.

The majority of these fish illustrations were drawn by University of Guelph student Rebecca Brebner.

Les conseils de consommation donnés dans la présente brochure portent sur des espèces particulières de poisson et, pour tirer parti de cette information, il importe d'identifier correctement les espèces que l'on prend.

Cette identification ne présente d'ordinaire pas de difficulté pour le pêcheur chevronné, mais les novices risquent d'avoir parfois un peu de mal à déterminer quel est le poisson qu'ils ont pris et ont envie de manger.

On trouvera dans les pages qui suivent des croquis des types de poissons qui se pêchent le plus souvent en Ontario. Chaque image est accompagnée d'une brève description indicative de la fourchette de dimensions et de poids où se situeront les poissons adultes que le pêcheur à la ligne a des chances de pêcher dans les lacs et cours d'eau de l'Ontario. Pour ceux qui auraient la chance de sortir une "grosse pièce", la taille record est indiquée pour beaucoup d'espèces aux fins de comparaison.

On donne également des renseignements sur l'habitat des poissons (H), leurs périodes de frai (F) et leur nourriture (N).

La plupart des illustrations sont de Rebecca Brebner, étudiante à l'université de Guelph.

## Northern Pike
## Brochet

Length/longueur 45-100 cm
18-39 in

Weight/poids 0.7-8.0 kg
1.5-17.5 lb

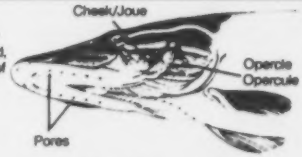
Record (Ontario) 19.11 kg
42.13 lb

D: quiet, heavily vegetated waters throughout Ontario
S: early spring
F: adults consume fish, but also take ducklings, frogs and small muskrats

*H: eaux calmes contenant beaucoup de végétation dans tout l'Ontario*
*F: début du printemps*
*N: le poisson adulte se nourrit de poisson et aussi de canetons, de grenouilles et de petits rats musqués*

## Pike

Cheek fully scaled, upper half of opercle only scaled, 10 pores on undersides of lower jaw. Northern pike *(E. lucius)*

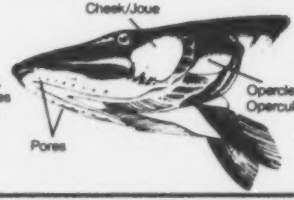


## Brochet

Joue recouverte d'écailles; partie supérieure de l'opercule recouverte d'écailles seulement; 10 pores sous la mâchoire inférieure. Brochet, *(E. lucius)*.

## Muskie

Cheek and opercle both scaled only on upper half, 12-18 pores on undersides of lower jaw. Great Lakes muskellunge *(E. masquinongy)*



## Maskinongé

Partie supérieure de la joue et de l'opercule recouverte d'écailles seulement; 12 à 18 pores sous la mâchoire inférieure. Maskinongé. *(E. masquinongy)*

## Muskellunge
## Maskinongé

Length/longueur 71-117 cm
28-46 in

Weight/poids 3.5-16.0 kg
8-35 lb

Record (Ontario) 147.3 cm/29.48 kg
58 in/65.0 lb

D: quiet, weedy areas of lakes and rivers
S: spring
F: mainly fish, but also crayfish, frogs, mice, muskrats and waterfowl

*H: eaux tranquilles et herbeuses des lacs et rivières*
*F: printemps*
*N: principalement du poisson, mais aussi des écrevisses, grenouilles, souris, rats musqués et oiseaux aquatiques*

## Walleye
## Doré

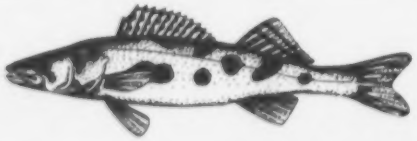
Length/longueur 25-85 cm
10-33 in
Weight/poids 0.25-6.8 kg
0.5-13 lb
Record (Ontario) 32.7 cm/15.04 kg
36.5 in/32.25 lb

D: mainly cold, clear waters throughout Ontario
S: early spring
F: mainly fish

*H: principalement eaux froides et claires dans tout l'Ontario*
*F: début du printemps*
*N: surtout du poisson*

## Sauger
## Doré noir

Length/longueur 25-41 cm
10-16 in
Weight/poids to 0.5 kg
1.0 lb



D: large, shallow, turbid waters throughout Ontario
S: late May and early June
F: fish, insects and freshwater shrimp

*H: vastes étendues d'eau trouble peu profonde dans tout l'Ontario*
*F: fin mai, début juin*
*N: poisson, insectes et crevettes d'eau douce*

## Yellow Perch
## Perchaude

Length/longueur 15-30 cm
6-12 in
Weight/poids 0.2-0.3 kg
0.4-0.7 lb
Record/Ontario 33.98 cm/0.82 kg
13.4 in/1.84 lb

D: clear waters with some vegetation throughout Ontario
S: April or May
F: insects, crayfish, snails and fish

*H: eaux claires contenant un peu de végétation dans tout l'Ontario*
*F: avril ou mai*
*N: insectes, écrevisses, escargots et poisson*

## Smallmouth Bass
## Achigan à petite bouche

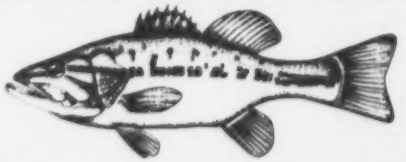
Length/longueur 25-50 cm
10-20 in
Weight/poids 0.5-2.3 kg
1-5 lb
Record (Ontario) 61.0 cm/4.46 kg
24 in/9.84 lb

D: clear, rocky waters with little vegetation from Southern Ontario to Timiskaming
S: June
F: fish, crayfish, insects

*H: eaux claires et rocheuses contenant peu de végétation du Sud de l'Ontario à Timmiskamingue*
*F: juin*
*N: poisson, écrevisses et insectes*

## Largemouth Bass
## Achigan à grande bouche

Length/longueur 25-55 cm
10-22 in
Weight/poids 0.3-2.3 kg
0.7-5 lb
Record (Ontario) 4.75 kg
10.48 lb

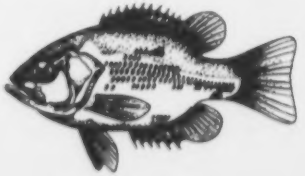


D: warm, weedy, slow or still waters with mud bottoms, in Southern Ontario
S: June
F: mainly fish, but also crayfish and frogs

*H: eaux chaudes, herbeuses, lentes ou tranquilles, au fond vaseux, dans le Sud de l'Ontario*
*F: juin*
*N: surtout du poisson, mais aussi des écrevisses et des grenouilles*

## Rock Bass
## Crapet de roche

Length/longueur 15-20 cm
6-8 in
Weight/poids 0.2-0.45 kg
0.5-1 lb

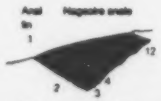


D: warm, clear, shallow, slow waters with gravel or rocky bottoms, northward to Lake Abitibi
S: spring
F: insects, crayfish, small fish

*H: eaux chaudes, claires, peu profondes au fond de roches ou de gravier jusqu'au lac Abitibi au nord*
*F: printemps*
*N: insectes, écrevisses, petits poissons*

## Chinook
## Saumon chinook

Length/longueur: 30–100 cm
12–39 in
Weight/poids: 0.5–18.0 kg
1–40 lb
Record (Ontario): 114.3 cm/20.58 kg
45 in/45.38 lb



Start ray count from first rudimentary ray no. 1. The last ray usually is branched to bottom.

Commencez à compter les rayons à partir du premier rayon rudimentaire (1). Le dernier rayon est généralement ramifié.

D: introduced into Great Lakes from Pacific West Coast
S: at maturity, swims up rivers to spawn in fall; dies after spawning
F: mainly smelt and alewives

*H: originaire de la côte du Pacifique et introduit dans les Grands Lacs de l'Ontario*
*F: à maturité, remonte les rivières pour frayer en automne; meurt ensuite*
*N: surtout des éperlans et des alevins*

## Pink Salmon
## Saumon rose

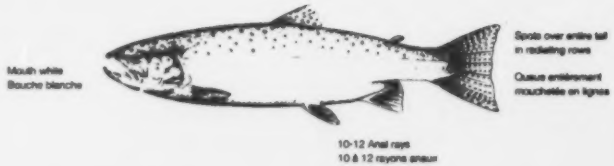
Length/longueur: to 46 cm
18 in
Record (Ontario): 72.69 cm/4.25 kg
28.62 in/9.36 lb

D: has spread naturally through Great Lakes after introduction from Pacific West Coast into Lake Superior
S: at maturity, travels up rivers to spawn in fall; dies after spawning
F: smelt, insects

*H: originaire de la côte du Pacifique, s'est naturellement dispersé dans les Grands Lacs après avoir été introduit dans le lac Supérieur*
*F: à maturité, remonte les rivières pour frayer en automne; meurt ensuite*
*N: éperlans, insectes*

## Rainbow Trout
## Truite arc-en-ciel

Length/longueur: 15–75 cm
6–30 in
Weight/poids: 0.2–5.5 kg
0.5–12 lb
Record (Ontario): 97.8 cm/13.21 kg
38.5 in/29.1 lb

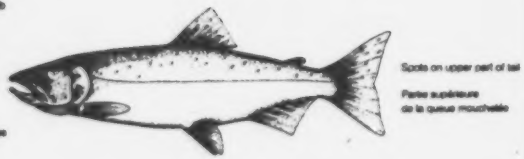


D: primarily a lake fish throughout Great Lakes area; introduced from Pacific West Coast
S: migrates up river to spawn from December to May
F: insects, freshwater shrimp, fish, snails, clams, leeches

*H: originaire de la côte du Pacifique; poisson vivant surtout dans les lacs de la région des Grands Lacs*
*F: remonte les rivières pour frayer de décembre à mai*
*N: insectes, crevettes d'eau douce, poisson, escargots, coquillages et sangsues*

## Coho
## Saumon coho

Length/longueur: 30–75 cm
12–30 in
Weight/poids: 0.5–6.0 kg
1–16 lb
Record (Ontario): 12.08 kg
26.64 lb



D: introduced into the Great Lakes in the mid 1960s from Pacific West Coast
S: swims up rivers in late fall to spawn at maturity, dies after spawning
F: mainly smelt and alewives

*H: originaire de la côte du Pacifique, introduit dans les Grands Lacs au milieu des années 1960*
*F: remonte les rivières pour frayer à maturité en automne; meurt ensuite*
*N: surtout des éperlans et des alevins*

## Atlantic Salmon
## Saumon atlantic

Length/longueur: 25–70 cm
10–28 in
Weight/poids: 0.5–3.6 kg
2–8 lb
Record (Ontario): 68.9 cm/11.02 kg
35 in/24.39 lb

D: recently stocked in Lake Ontario and Trout Lake (North Bay)
S: fall; may enter rivers from mid-summer; can spawn more than once
F: mainly smelt and alewives in Lake Ontario

*H: stocké récemment dans lac Ontario et lac Trout (North Bay)*
*F: automne; peut remonter les rivières du milieu d'été, peut frayer plusieurs fois*
*N: surtout des éperlans et des alevins dans lac Ontario*

## Lake Trout
## Truite de lac

Length/longueur: 30–80 cm
12–31 in
Weight/poids: 0.27–4.5 kg
0.6–10 lb
Record (Ontario): 130.8 cm/28.63 kg
51.5 in/63.1 lb

D: cool waters of deep lakes throughout much of Ontario
S: October
F: fish, insect larvae and plankton

*H: eaux fraîches des lacs profonds dans tout l'Ontario*
*F: octobre*
*N: poisson, larves d'insectes et plancton*

## Brown Trout
## Truite brune

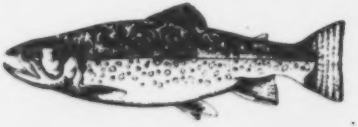
Length/longueur: 15–65 cm
6–16 in
Weight/poids: 0.2–4.5 kg
0.5–10 lb
Record (Ontario): 92 cm/14.06 kg
36.2 in/31 lb

D: introduced from Europe into Southern Ontario streams
S: fall
F: insects, fish, crayfish, worms

*H: originaire d'Europe et introduite dans les cours d'eau du Sud de l'Ontario*
*F: automne*
*N: insectes, poisson, écrevisses et vers*

## Brook Trout
## Truite mouchetée

Length/longueur: 15–40 cm
6–16 in
Weight/poids: 0.2–0.9 kg
0.5–2 lb
Record (Ontario): 60.0 cm/6.58 kg
31.5 in/14.5 lb



D: cool, clear streams and small lakes
S: late fall
F: insects, fish, crayfish, clams, snails

*H: cours d'eau frais et clairs et petits lacs*
*F: fin de l'automne*
*N: insectes, poisson, écrevisses, coquillages et escargots*

## Whitefish
## Grand corégone

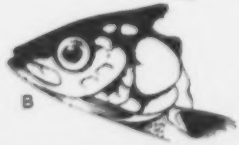
Length/longueur 30-65 cm
12-26 in
Weight/poids 0.3-4.0 kg
0.6-9 lb
Record (Ontario) 6.57 kg
14.36 lb

D: many inland lakes from Great Lakes to Hudson Bay
S: November and December
F: aquatic insect larvae, clams, snails and plankton

*H: surtout lacs intérieurs des Grands Lacs à la baie d'Hudson*
*F: de novembre à décembre*
*N: larves d'insectes aquatiques, coquillages, escargots et plancton*

Profiles of whitefish and herring showing differences due to position of snout or upper jaw.

**Whitefish**
A. The mouth is overhung by the snout or upper jaw; rounded profile. Whitefish *(Coregonus clupeaformis)*.



**Cisco**
B. The mouth is not overhung by the snout; pointed profile. Lake herring, *(Coregonus artedi)*.

Profils du corégone et du cisco : remarquez la position du museau (mâchoire supérieure).

**Grand corégone**
A. Le museau (mâchoire supérieure) est en saillie sur la bouche. Profil arrondi. Corégone *(Coregonus clupeaformis)*

**Cisco de lac**
B. Le museau n'est pas proéminent ; profil pointu. Cisco de lac. *(C. artedii)*.

## Cisco (Lake Herring)
## Cisco de lac (Hareng de lac)

Length/longueur 20-30 cm
8-12 in
Weight/poids 0.3-0.5 kg
0.6-1 lb

D: cold waters throughout Great Lakes to Hudson Bay
S: November or December
F: mainly plankton, but also aquatic insects, clams and snails

*H: eaux froides des Grands Lacs à la baie d'Hudson*
*F: novembre ou décembre*
*N: principalement du plancton, mais aussi des insectes aquatiques, coquillages et escargots.*

## Channel Catfish
## Barbue de rivière

Length/longueur 36-53 cm
14-21 in
Weight/poids 0.9-1.8 kg
2-4 lb

D: Great Lakes and larger lakes and rivers in Southern Ontario and parts of Northern Ontario
S: spring or summer
F: fish, aquatic insects, crayfish, clams and snails

*H: Grands Lacs et lacs ou rivières plus importants du Sud de l'Ontario et de certaines régions du Nord*
*F: printemps ou été*
*N: poisson, insectes aquatiques, écrevisses, coquillages et escargots*

## Brown Bullhead
## Barbotte brune

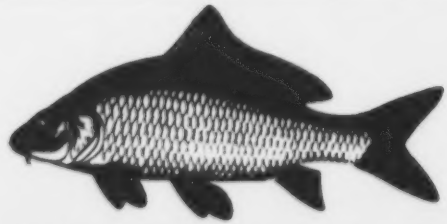
Length/longueur 20-36 cm
8-14 in
Weight/poids 0.3-0.45 kg
0.6-1 lb
Record (Ontario) 41.26 cm/1.08 kg
16.25 in/2.38 lb

D: warm, slow waters throughout Southern Ontario and parts of Northern Ontario
S: spring
F: insect larvae, crayfish, worms, clams, snails, fish and plant material

*H: eaux chaudes et tranquilles du Sud de l'Ontario et de certaines régions du Nord*
*F: printemps*
*N: larves d'insectes, écrevisses, vers, coquillages, escargots, poisson et plantes*

## Carp
## Carpe

Length/longueur 30-75 cm
12-30 in
Weight/poids 0.5-11.0 kg
1-24 lb



D: widely introduced into Ontario in shallow, fairly warm waters
S: June and July
F: insect larvae, crayfish, snails and plants

*H: très commune dans tout l'Ontario dans les eaux peu profondes et relativement chaudes*
*F: juin et juillet*
*N: larves d'insectes, écrevisses, escargots et plantes*

## Round Whitefish
## Menomini rond

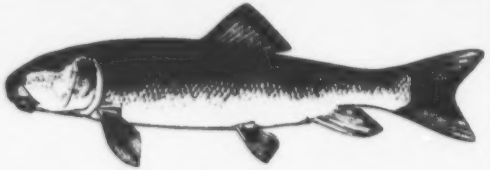
Length/longueur: 20-40 cm
8-16 in
Weight/poids: average 0.45 kg
moyen 1.0 lb

D: usually found in deep lakes in Southern Ontario and Great Lakes
S: fall
F: bottom feeder, eating aquatic insect larvae, clams and snails

*H: d'ordinaire, lacs profonds du Sud de l'Ontario et Grands Lacs*
*F: automne*
*N: se nourrit au fond de l'eau; larves d'insectes aquatiques, coquillages et escargots*

## White Sucker
## Meunier noir

Length/longueur: 30-90 cm
12-36 in
Weight/poids: 0.45-0.9 kg
1-2 lb

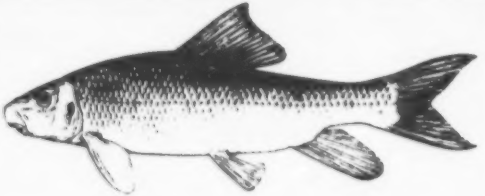


D: warm shallow lakes and tributary rivers of larger lakes
S: spring
F: sucks up bottom material for aquatic insects, clams, worms, and aquatic plant material

*H: lacs chauds et peu profonds et rivières se jetant dans des lacs plus étendus*
*F: printemps*
*N: aspire la vase du fond pour y trouver des insectes aquatiques, des escargots, des vers, et des plantes*

## Redhorse Sucker
## Suceur rouge

Length/longueur: 30-46 cm
12-18 in
Weight/poids: 0.45-0.9 kg
1-2 lb

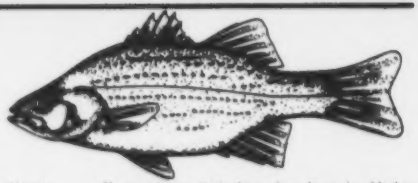


D: throughout Ontario
S: spring
F: sucks up bottom material for aquatic insects, snails and clams

*H: tout l'Ontario*
*F: printemps*
*N: aspire la vase du fond pour y trouver des insectes aquatiques, des escargots et des coquillages*

## White Bass
## Bar blanc

Length/longueur: 20-30 cm
8-12 in
Weight/poids: to 0.7 kg
1.5 lb

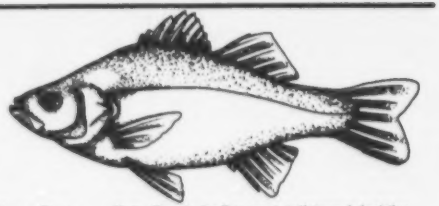


D: clear waters near rock reefs and sand bars in lower Great Lakes areas
S: spring
F: small fish, insects, small plant material and crayfish

*H: eaux claires près des bancs de roches et de sable dans les régions inférieures des Grands Lacs*
*F: printemps*
*N: petits poissons, insectes, petites plantes et écrevisses*

## White Perch
## Bar-perche

Length/longueur: 15-25 cm
6-10 in
Weight/poids: 0.2-0.5 kg
0.5-1 lb

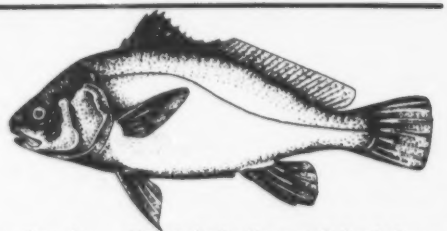


D: Lake Ontario, Lake Erie, lower Niagara River and Welland Canal
S: May and June
F: insects and fish

*H: lac Ontario, lac Erie, partie inférieure de la rivière Niagara et canal Welland*
*F: mai et juin*
*N: insectes et poisson*

## Freshwater Drum
## Malachigan

Length/longueur: 45-50 cm
18-20 in
Weight/poids: 0.5-1.0 kg
1-2 lb
Record (Ontario): 79.9 cm/7.33 kg
31.46 in/16.17 lb



D: large shallow waterbodies with mud or sandy bottoms
S: spring or early summer
F: feed on bottom, eating snails, crayfish, fish and insects

*H: grandes étendues d'eau peu profonde au fond vaseux ou sablonneux*
*F: printemps ou début de l'été*
*N: se nourrit au fond de l'eau d'escargots, d'écrevisses, de poisson et d'insectes*

## White Crappie
## Marigane blanche

Length/longueur 20-30 cm
8-12 in

D: mouths of tributary streams or weedy sheltered bays in lower Great Lakes area
S: late spring or early summer
F: aquatic insects, small fish

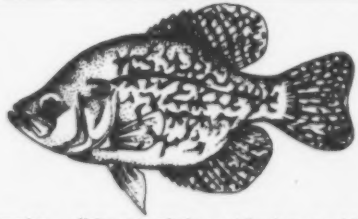
*H: embouchure des cours d'eau affluents ou baies abritées et herbeuses de la région intérieure des Grands Lacs*
*F: fin du printemps ou début de l'été*
*N: insectes aquatiques, petits poissons*

## Black Crappie
## Marigane noire

Length/longueur 18-25 cm
7-10 in

Weight/poids 0.25-0.5 kg
0.5-1 lb

Record (Ontario) 43.2 cm/1.71 kg
17 in/3.78 lb



D: clear, weedy lakes and slow rivers northward to Sault Ste. Marie
S: May and June
F: small fish, insects and crayfish

*H: lacs clairs et herbeux et rivières lentes au sud de Sault Ste. Marie*
*F: mai et juin*
*N: petits poissons, insectes et écrevisses*

## Pumpkinseed
## Crapet-soleil

Length/longueur 18-23 cm
7-9 in

Weight/poids less than 0.2 kg
0.5 lb

D: clear, shallow weedy waters northward to Temagami
S: spring
F: insects, snails

*H: eaux claires et herbeuses au sud de Temagami*
*F: printemps*
*N: insectes, escargots*

## Ling (Burbot)
## Lotte

Length/longueur to 38 cm
15 in

D: cool waters of lakes and rivers throughout Ontario
S: late winter or early spring
F: fish, crayfish, freshwater shrimp and insects

*H: eaux fraîches des lacs et des rivières dans tout l'Ontario*
*F: fin de l'hiver ou début du printemps*
*N: poissons, écrevisses, crevettes d'eau douce et insectes*

## American Eel
## Anguille d'Amérique

Length/longueur 61-91 cm
2-3 ft

D: mainly in St. Lawrence River and Ottawa River drainage, and Lake Ontario
S: adults spawn once in Atlantic Ocean in fall, then die; young return to lakes and rivers in spring
F: fish, aquatic insect larvae, crayfish, snails, earthworms

*H: surtout le bassin du fleuve Saint-Laurent et de la rivière des Outaouais et lac Ontario*
*F: les adultes frayent une fois dans l'océan Atlantique en automne puis meurent; les jeunes poissons reviennent dans les lacs et rivières au printemps*
*N: poisson, larves d'insectes aquatiques, écrevisses, escargots et vers de terre*

## Bowfin
## Poisson castor

Length/longueur 46-61 cm
18-24 in

Weight/poids 0.9-1.4 kg
2-3 lb

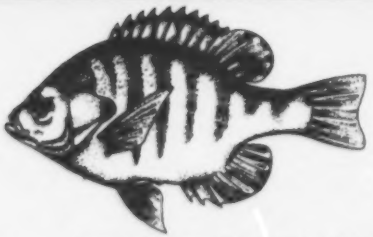
Record (Ontario) 81.3 cm/6.15 kg
32 in/13.56 lb

D: swampy vegetated bays of warm lakes and rivers
S: spring
F: fish, crayfish, frogs

*H: baies marécageuses et herbeuses des lacs et des rivières d'eau chaude*
*F: printemps*
*N: poisson, écrevisses, grenouilles*

## Bluegill
## Crapet arlequin

Length/longueur: 15-30 cm
6-12 in
Record (Ontario): 24.8 cm/0.40 kg
0.76 m/0.88 lb



D: warm, vegetated still waters throughout Southern Ontario
S: spring and summer
F: insects, vegetation

*H: eaux chaudes et tranquilles couvrant de la végétation dans tout le Sud de l'Ontario*
*F: printemps et été*
*N: insectes et végétation*

## Goldeye
## Laquaiche aux yeux d'or

Length/longueur: 25-38 cm
10-15 in

D: parts of NE & NW Ontario often in swift silty waters
S: spring
F: insects, snails, crayfish, fish

*H: régions du N-E et du N-O de l'Ontario, souvent dans les eaux rapides et alluviales*
*F: printemps*
*N: insectes, escargots, écrevisses et poisson*

## Mooneye
## Laquaiche argentée

Length/longueur: 25-30 cm
10-12 in

D: clear rivers and shallow waters of lakes
S: spring
F: fish, insects, snails and small plant matter

*H: rivières claires et eaux peu profondes des lacs*
*F: printemps*
*N: poisson, insectes, escargots et petites plantes*

## Sturgeon
## Esturgeon de lac

Length/longueur: 90-145 cm
3-5 ft
Weight/poids: 4.5-36 kg
10-80 lb

D: larger rivers and lakes, usually in depths less than 30 feet
S: spring; attain great ages, not maturing until about 20 years of age
F: bottom feeder, consuming insect larvae, snails and crayfish

*H: grands lacs et rivières, d'ordinaire à moins de 30 pieds de profondeur*
*F: printemps; vit longtemps et ne parvient pas à maturité avant environ 20 ans*
*N: se nourrit au fond de larves d'insectes, d'escargots et d'écrevisses*

## Rainbow Smelt
## Éperlan arc-en-ciel

Length/longueur: 15-25 cm
6-10 in

D: throughout Great Lakes area
S: late April
F: small fish, small aquatic life, worms

*H: toute la région des Grands Lacs*
*F: fin avril*
*N: petits poissons, petites créatures aquatiques, vers*

# Fish Names[1]

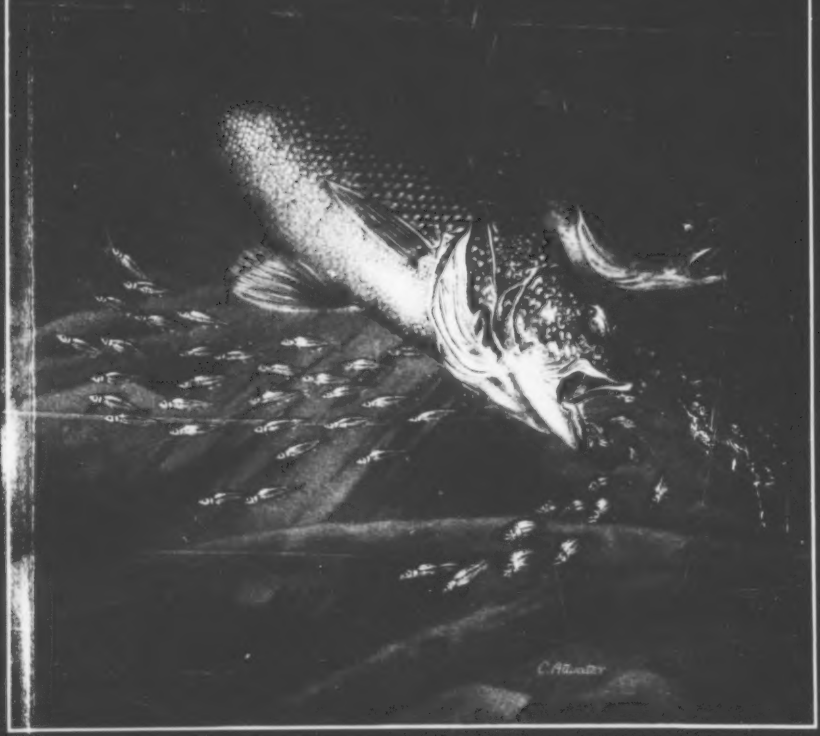
# GUIDE 1990

## POUR LA CONSOMMATION DU POISSON GIBIER DE L'ONTARIO



Ministère de l'Environnement
Ontario

Ministère des Richesses naturelles
Ontario

## Guide de consommation du poisson gibier

| Fréquence de consommation |  | | | | |
|---|---|---|---|---|---|
| Consommation à long terme | Pas de restrictions | 0,2 kg/sem (0,5 lb/sem.) | 0,1 kg/sem (0,3 lb/sem.) | 1 ou 2 repas par mois 0,5 kg/mois (1 lb/mois) | Aucun |
| Vacances d'une semaine | Pas de restrictions | 10 repas 2,3 kg (5 lb) | 7 repas 1,5 kg (3 lb) | 1 ou 2 repas 0,5 kg (1 lb) | Aucun |
| Vacances de deux semaines | Pas de restrictions | 5 repas par sem 1,3 kg/sem (2,8 lb/sem.) | 4 repas par sem 0,8 kg/sem (1,9 lb/sem.) | 1 ou 2 repas par sem 0,5 kg/sem (1 lb/sem.) | Aucun |
| Vacances de trois semaines | Pas de restrictions | 4 repas par sem 1 kg/sem (2,1 lb/sem.) | 3 repas par sem 0,6 kg/sem (1,4 lb/sem.) | 1 ou 2 repas par sem 0,5 kg/sem (1 lb/sem.) | Aucun |

**Les enfants de moins de 15 ans et les femmes en âge de procréer ne devraient manger que des poissons représentés par** .

## Polluants analysés

Le chiffre indique le polluant ou groupe de polluants pour lequel le poisson a été analysé :

1 Mercure
2 Mercure, BPC, mirex et pesticides
3 BPC, mirex et pesticides
4 Mercure, BPC et mirex
5 Mercure, autres métaux, BPC, mirex et pesticides
6 Mercure et autres métaux
7 2,3,7,8-TCDD (dioxine)
8 Toxaphène

# Avant-propos

Le *Guide pour la consommation du poisson gibier de l'Ontario* indique aux pêcheurs et aux consommateurs tout ce qu'il faut savoir avant de consommer, dans les limites recommandées, le poisson gibier des lacs et rivières de la province et de nombreux endroits des Grands Lacs et des passages qui les relient.

Ce guide, révisé chaque année, est le fruit du travail de techniciens, d'analystes, de scientifiques et de médecins au service des ministères ontariens de l'Environnement, des Richesses naturelles et du Travail.

Cette quatorzième édition du guide, mise à jour en février 1990, offre des conseils sur la consommation du poisson pour quelque 1 700 endroits de la province. Un index des emplacements figure à la suite des tableaux.

Le personnel du ministère des Richesses naturelles se charge de prendre le poisson, qu'il achemine ensuite aux laboratoires du ministère de l'Environnement où l'on recherche une variété de substances, dont le mercure, les BPC, le mirex et le DDT. Les résultats obtenus servent à élaborer les tableaux publiés dans ce guide. On trouve dans ces tableaux des conseils sur la consommation du poisson en fonction de la taille, de l'espèce et de la provenance. Ces conseils sont basés sur les directives fédérales pour la protection de la santé.

Le prélèvement du poisson et son analyse s'inscrivent dans un processus continu. Les ressources sont réparties également entre l'analyse de nouveaux plans d'eau et l'analyse répétée des emplacements où la concentration de polluants risque de fluctuer. En étudiant une même espèce au même endroit sur plusieurs années, les scientifiques peuvent suivre l'évolution de certains polluants chez cette espèce. Dans certains cas, les données obtenues aident à isoler les sources de pollution, ce qui permet alors de contrôler les déversements.

Pour signaler une source de pollution ou une hécatombe de poissons, communiquer avec le bureau le plus proche du ministère de l'Environnement, dont l'on trouvera les coordonnées à la rubrique des adresses.

Si l'on désire de plus amples renseignements sur la réglementation de la pêche, les prises maximales et les périodes d'ouverture, se procurer un exemplaire des *Règlements relatifs à la pêche sportive en Ontario* à un des bureaux du ministère des Richesses naturelles, dont l'adresse figure aussi dans le guide.

Pour obtenir des données précises sur un endroit analysé ou de plus amples renseignements sur le contenu du présent guide et des versions antérieures, prière de s'adresser au :

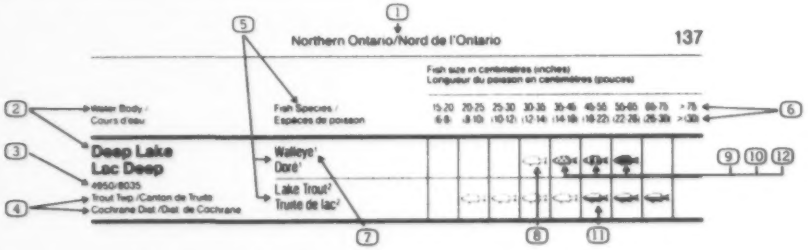
# Guide d'utilisation des tableaux

Les tableaux du présent guide contiennent des renseignements précieux sur la consommation du poisson gibier en fonction de la concentration de polluants, de l'espèce, de la taille et de l'endroit.

Il est important de noter que les analyses de laboratoire sont effectuées sur le tissu non adipeux du muscle dorsal, sans arêtes ni peau, et que les directives de consommation sont établies d'après cette partie du poisson. Il est certain que d'autres sections, comme le poisson entier, les darnes ou le gras du ventre, peuvent contenir des concentrations plus élevées du substances organiques telles les BPC, le mirex, le DDT ou la 2,3,7,8-TCDD, car ces polluants s'accumulent davantage dans les tissus adipeux. Il est donc recommandé de retirer la peau et les arêtes de ces poissons avant de les consommer.

Les noms des plans d'eau et de leur emplacement sont tirés du *Répertoire géographique du Canada (Ontario)*. La description comprend la latitude et la longitude, ce qui permet aux pêcheurs de consulter la Carte routière officielle de l'Ontario, où la latitude et la longitude sont indiquées dans la marge, pour trouver l'emplacement approximatif. Ils peuvent ensuite avoir recours à des cartes topographiques à grande échelle pour situer l'endroit avec précesion. L'index, que l'on trouvera dans les pages jaunes du présent guide, donne la liste alphabétique de tous les emplacements analysés.

Voici la légende des tableaux, pour le lac Deep; lac hypothétique.



## Emplacement des cours d'eau

① Les tableaux sont divisés en trois sections par région : sud de l'Ontario, nord de l'Ontario et Grands Lacs, laquelle figure au haut de la page

② Le nom de l'emplacement

③ Sa latitude et sa longitude

④ Le canton, comté ou district territorial

## Espèces analysées

⑤ Les espèces analysées sont habituellement celles qui sont particulièrement susceptibles de présenter une concentration élevée de polluants (voir la section intitulée *Choix des espèces à analyser*)

## Longueur du poisson

⑥ La longueur totale du poisson est mesurée, à partir du bout de la mâchoire jusqu'à l'extrémité de la queue. Elle est exprimée en centimètres et en pouces (entre parenthèses).

## Polluants analysés

⑦ Le chiffre indique le polluant ou groupe de polluants pour lequel le poisson a été analysé :

1 Mercure
2 Mercure, BPC, mirex et pesticides
3 BPC, mirex et pesticides
4 Mercure, BPC et mirex
5 Mercure, autres métaux, BPC, mirex et pesticides
6 Mercure et autres métaux
7 2,3,7,8-TCDD (dioxine)
8 Toxaphène

Le fait qu'on ait recherché un groupe particulier de polluants ne signifie pas forcément que le poisson contiendra toutes ces substances. Par exemple, un poisson

analysé pour le groupe 4 peut contenir uniquement du mercure et aucune trace de BPC ou de mirex.

Pour certains endroits, on a recherché la présence de mercure seulement, puisqu'il est le seul polluant pour lequel il y a lieu de limiter la consommation.

## Symboles utilisés

### Consommation illimitée

⑨ Il s'agit de la seule catégorie de poisson de consommation sûre pour les femmes en âge de procréer (les femmes enceintes ou qui songent à le devenir et les mères qui allaitent) et les enfants de moins de 15 ans. Aucune des substances recherchées n'a été décelée à une concentration qui puisse justifier une restriction de la consommation.

### Consommation restreinte

⑨ Ces poissons doivent être consommés en quantité limitée, car leur concentration de mercure est de l'ordre de 0,5 à 1,0 partie par million.

⑩ La consommation de ces poissons est restreinte davantage, car leur teneur en mercure atteint 1,0 à 1,5 partie par million.

⑪ La consommation de ces poissons est restreinte, car ils contiennent un ou plusieurs polluants organiques de source industrielle, tels les BPC ou le mirex, à une concentration supérieure à la limite fédérale.

### Consommation déconseillée

⑫ Aucun de ces poissons ne devrait être consommé, car ils contiennent du mercure à des concentrations supérieures à la limite de 1,5 partie par million fixée par le gouvernement fédéral.

## Directives pour la consommation

Le tableau ci-dessous donne la quantité maximale de poisson gibier de l'Ontario qu'il est recommandé de consommer. Ce chiffre a été établi en fonction de la teneur en polluants et de la fréquence de consommation.

De nombreux pêcheurs ontariens prennent et consomment du poisson toute l'année. Ce sont donc des consommateurs à long terme qui ont intérêt à consulter la catégorie à leur intention dans le tableau. Certains pêcheurs, par contre, prennent et consomment du poisson uniquement pendant leurs vacances annuelles. Ces pêcheurs doivent se reporter à la catégorie pertinente selon qu'ils en consomment pendant une, deux ou trois semaines.

Les quantités maximales recommandées sont indiquées en nombre de repas et en poids total par semaine. Un repas représente 230 g (0,5 lb). Les femmes en âge de procréer et les enfants de moins de 15 ans ne devraient consommer que du poisson de la catégorie .

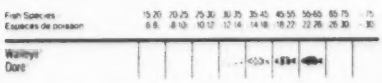
### Guide de consommation du poisson gibier

| Fréquence de consommation | | | | | |
|---|---|---|---|---|---|
| Consommation à long terme | Pas de restrictions | 0,2 kg/sem. (0,5 lb/sem.) | 0,1 kg/sem. (0,3 lb/sem.) | 1 ou 2 repas par mois 0,5 kg/mois (1 lb/mois) | Aucun |
| Vacances d'une semaine | Pas de restrictions | 10 repas 2,3 kg (5 lb) | 7 repas 1,5 kg (3 lb) | 1 ou 2 repas 0,5 kg (1 lb) | Aucun |
| Vacances de deux semaines | Pas de restrictions | 5 repas par sem. 1,3 kg/sem. (2,8 lb/sem.) | 4 repas par sem. 0,8 kg/sem. (1,9 lb/sem.) | 1 ou 2 repas par sem. 0,5 kg/sem. (1 lb/sem.) | Aucun |
| Vacances de trois semaines | Pas de restrictions | 4 repas par sem. 1 kg/sem. (2,1 lb/sem.) | 3 repas par sem. 0,6 kg/sem. (1,4 lb/sem.) | 1 ou 2 repas par sem. 0,5 kg/sem. (1 lb/sem.) | Aucun |

**Les enfants de moins de 15 ans et les femmes en âge de procréer ne devraient manger que des poissons représentés par .**

Exemple :
Pendant une partie de pêche de trois semaines au lac Deep, un vacancier prend un doré mesurant 40 cm (16 po) et il veut savoir si ce poisson est bon à manger. Il doit d'abord :

- Trouver le lac Deep dans les tableaux du guide :



- Prendre note que le doré mesurant entre 35 et 45 cm (14-18 po) est suivi du symbole .
- Puisque le symbole n'y est pas, le pêcheur sait automatiquement que le poisson ne doit pas être consommé par une femme en âge de procréer ou un enfant de moins de 15 ans.
- Si le poisson ne sera pas consommé par une femme en âge de procréer ou un enfant de moins de 15 ans, le pêcheur consultera le tableau qui figure à la deuxième page de la couverture et se reportera à la catégorie «trois semaines». D'après le tableau, la consommation maximale recommandée est de quatre repas, ou un kilogramme, par semaine.

# Le programme de surveillance de la contamination du poisson gibier

## Choix des emplacements à analyser

Étant donné que l'Ontario compte plus de 250 000 lacs, d'innombrables rivières et ruisseaux et quantité de lieux de pêche sur les Grands Lacs, il ne serait ni pratique ni économique de les analyser tous.

On peut décider d'analyser un emplacement pour une ou plusieurs des raisons suivantes :

- il s'agit d'une zone de pêche populaire
- il existe à proximité une source connue ou probable de pollution
- c'est une source importante de nourriture pour les habitants du lieu (cas, généralement, des lacs voisins de réserves indiennes)
- une aire de loisirs est sur le point d'y être aménagée
- il fait partie d'un programme d'étude à long terme des contaminants du poisson

Le choix des masses d'eau à étudier est un processus continu auquel le public est invité à participer.

## Choix des espèces à analyser

La plupart des lacs et cours d'eau contiennent diverses espèces de poissons. Lorsqu'il s'agit de choisir les espèces à analyser, il convient de noter que toutes n'accumulent pas nécessairement un polluant donné à des concentrations semblables.

Ainsi, à taille égale, un poisson d'une certaine espèce peut avoir une concentration de polluants beaucoup plus faible qu'un poisson d'une autre espèce. Cela tient à des différences sur les plans de l'alimentation, de l'habitat, de la croissance et de la physiologie.

C'est ainsi que la teneur en mercure d'un poisson comme le doré ou le brochet sera probablement plus élevée, à taille égale, que chez une espèce comme le grand corégone.

En effet, le doré et le brochet, qui sont à l'extrémité de la chaîne alimentaire, sont de gros carnivores qui se nourrissent de poissons plus petits susceptibles d'avoir eux aussi une forte concentration de mercure.

Le corégone, par contre, se nourrit, à un niveau inférieur de la chaîne alimentaire, d'insectes et invertébrés aquatiques qui contiennent moins de mercure que les petits poissons.

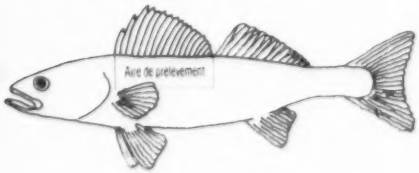
La pratique est donc, quand on étudie les poissons d'une aire donnée pour déterminer leur teneur en mercure, de choisir des gros carnivores, car ils présenteront les concentrations les plus élevées. Si l'analyse des carnivores révèle de faibles concentrations, il n'y aura peut-être pas lieu d'analyser d'autres espèces.

Lorsqu'on recherche des polluants organiques tels les BPC et le mirex, il convient d'étudier les espèces à chair très grasse, comme le saumon, la truite de lac, l'éperlan et la

perchaude, étant donné que ces polluants ont tendance à se concentrer dans les tissus adipeux. Encore une fois, si les espèces à chair grasse ne renferment pas de grandes quantités de polluants organiques, les espèces à chair moins grasse n'auront probablement pas besoin d'être analysés.

## Prélèvement des poissons à analyser

La plupart des poissons sont prélevés par le personnel du ministère des Richesses naturelles, qui les prend au filet selon diverses méthodes. Autant que possible, l'échantillon comprend 20 poissons de chaque espèce, dont la longueur et le poids sont représentatifs de la gamme de tailles de cette espèce pour le lac à l'étude. On note la longueur, le poids et le sexe de chaque poisson. Un filet du muscle dorsal sans arêtes ni peau est prélevé (voir illustration), emballé et surgelé avant d'être expédié au laboratoire du ministère de l'Environnement, à Toronto ou Thunder Bay.



## Analyse supplémentaire des lieux de pêche

Depuis la seconde moitié des années 1970, les responsables du Programme de surveillance de la contamination du poisson gibier ajoutent en moyenne 100 emplacements à la liste tous les ans. On compte aujourd'hui plus de 1 700 emplacements à analyser.

Dans le cadre de ce programme, on réanalyse aussi des lacs et rivières, s'il y a lieu. Dans les régions éloignées des activités humaines, là où les poissons sont relativement à l'abri de la pollution, toute restriction de la consommation se limite habituellement aux endroits où on a relevé une concentration élevée de mercure chez les grands et vieux spécimens d'espèces carnivores, telles le doré et le brochet. Le mercure, dans ces régions, provient en grande partie de sources naturelles qui ne changent pas beaucoup avec le temps; par conséquent, la concentration de mercure chez les poissons varie très peu. Dans les régions polluées par les activités humaines, les contaminants possibles sont beaucoup plus nombreux et leur accumulation chez les poissons sera souvent proportionnelle au niveau de pollution.

Les emplacements à réanalyser ont répartis en trois groupes :

- Les emplacements où la concentration d'un ou de plusieurs polluants est anormalement élevée ou change subitement. Les poissons y sont analysés à intervalles de un à trois ans, selon leur popularité auprès des pêcheurs ou selon qu'ils constituent ou non une source importante de nourriture pour les habitants de la région.
- Les emplacements où la concentration de polluants est assez stable mais qui ont la faveur des pêcheurs à la ligne. Ces endroits sont analysés au moins tous les cinq ans.
- Tous les autres emplacements, le plus souvent des endroits éloignés des grandes sources de pollution où le taux de contamination des poissons est stationnaire. Les poissons de ces endroits sont analysés quand les ressources le permettent, environ tous les dix ans.

## Analyse des poissons

Non seulement le filet du muscle dorsal, sans arêtes ni peau, donne-t-il les résultats les plus probants, mais c'est également la partie la plus savoureuse de la plupart des poissons. Il est recommandé de retirer la peau et les arêtes quand un individu est contaminé par des polluants organiques tels les BPC et le mirex.

L'analyse du tissu pour déterminer la présence de polluants se fait aux laboratoires du ministère de l'Environnement par diverses méthodes, selon le ou les polluants auxquels on s'intéresse.

## Comment nettoyer et conserver le poisson

Si l'on désire conserver et consommer le poisson que l'on a pris, il est important de le garder dans le meilleur état possible jusqu'au moment de l'apprêter. On doit mettre un poisson fraîchement pêché sur de la glace ou le réfrigérer dans les plus brefs délais pour éviter qu'il ne se gâte. Ensuite, il faut le nettoyer, le vider, le réfrigérer ou le traiter le plus tôt possible.

Voici une des méthodes les plus couramment employées pour vider, découper en filets et dépouiller le poisson :

- Couper la paroi ventrale de la fente anale à la tête et retirer les viscères.
- Retrancher la tête et couper les nageoires.
- Poser le poisson à plat sur la planche à découper. À l'aide d'un couteau à lame fine bien aiguisé, trancher la peau et la chair qui se trouve derrière la tête jusqu'à l'arête centrale. Puis fendre le poisson d'un bout à l'autre de la partie dorsale en glissant le couteau le long de l'arête centrale jusqu'à la queue.
- Détacher l'autre côté de la même manière.
- Pour enlever les arêtes, poser le filet sur la planche, le côté peau dessous. En insérant la lame sous les arêtes, les détacher du filet en y laissant le moins de chair possible. Retrancher ensuite la nageoire pelvienne ainsi que le gras de la partie ventrale du filet.
- Poser le filet sur la planche, le côté peau dessous. Le couteau bien à plat, glisser celui-ci entre la peau et la chair, de la queue à la tête, en remontant par petites saccades.

On obtient ainsi un filet sans peau ni arêtes. Laver ensuite à grande eau froide et faire cuire, réfrigérer, congeler ou mariner.

## Comment remettre votre prise à l'eau

Un certain nombre de pêcheurs pratiquent la pêche sportive pour vivre l'émotion de la prise, et remettent le poisson à l'eau. Si vous décidez de ne pas garder un poisson, voici quelques mesures à prendre pour éviter de l'endommager :

1. Il est important de faire vite. Enlever l'hameçon le plus tôt possible et relâchez le poisson. Un poisson qui a été manipulé trop longtemps ne pourra reprendre ses forces. S'il est pris en eau profonde, il doit être ramené lentement vers la surface pour qu'il puisse se faire aux changements de pression et de température.
2. Garder le poisson submergé le plus longtemps possible, car il ne peut respirer hors de l'eau. Ne pas le laisser se débattre contre le sol ou les roches. Quelques pouces d'eau suffisent pour amortir les coups.
3. Il est essentiel de manipuler le poisson avec précaution et avec les mains humides. Ne pas lui mettre les doigts dans les yeux ou les branchies. Il ne faut pas serrer les petits poissons, mais les tenir par la lèvre inférieure. Un filet pourra faciliter la tâche, mais il faut le garder sous l'eau.
4. Retirer l'hameçon le plus rapidement possible à l'aide d'une pince à becs longs. Si l'hameçon s'est enfoncé profondément, couper la ligne et laisser l'hameçon là où il est. Il se dissoudra et ne nuira pas au poisson. Il ne faut surtout pas essayer d'arracher l'hameçon.
5. Pour ranimer un poisson, le tenir à la verticale dans l'eau qui coule vers l'amont (s'il y a du courant). Lui faire reprendre sa respiration en le déplaçant de l'avant à l'arrière pour que l'eau puisse s'infiltrer dans les branchies. Cela peut prendre quelques minutes. Relâcher le poisson quand il commence à se débattre.

## Parasites

Il arrive parfois qu'un pêcheur prenne un poisson qui est infesté de vers ou de larves ou qui a des kystes ou nodules dans la chair. En nettoyant le poisson, il peut découvrir des vers dans la région intestinale ou des moisissures sur la peau, les nageoires ou les ouïes. La présence de ces parasites est tout à fait normale, car ils font partie de l'écosystème dans lequel évoluent les poissons. Même si elles ne sont pas appétissantes, les parties

comestibles qui contiennent des parasites ne présentent aucun danger pour la santé lorsqu'elles sont bien cuites.

Parmi les parasites les plus répandus chez les poissons, mentionnons les taches noires de l'achigan et de la perchaude, les sangsues, les pous et les douves des ouïes.

## Tumeurs

Les pêcheurs prennent parfois des poissons qui présentent des excroissances, des tumeurs, des plaies ou des lésions. En général, celles-ci sont dues à des infections virales ou bactériennes. On trouve parfois des anomalies du foie ou des intestins chez les espèces communes telles la carpe noire et la barbotte brune; elles sont le résultat d'une infection parasitaire ou d'une tumeur. Les effets possibles de ces maladies sur les poissons et le rôle incertain de la pollution dans leur apparition ont conduit à des recherches pour déterminer la cause de ces anomalies. Parmi les excroissances d'origine virale qu'on observe sur le poisson gibier, il y a la lymphocystite, le lymphosarcome et le sarcome cutané.

La lymphocystite, maladie virale qui touche surtout le doré et la perchaude, est une maladie très répandue au Canada. Le virus infecte la peau du poisson et se transmet d'un individu à l'autre au cours des migrations printanières, à l'occasion de la fraie. Il provoque l'apparition de protubérances blanchâtres en forme de chou-fleur. La lymphocystite ne tue pas le poisson. Des études ont en effet révélé qu'il pouvait ne plus présenter d'excroissances dès le printemps suivant. Un poisson atteint de lymphocystite ne pose pas de risque connu et peut être consommé sans danger une fois dépouillé et bien cuit.

Le sarcome cutané est une autre maladie virale qui s'attaque au doré en infectant ses cellules et provoquant la croissance de tumeurs juste au-dessous de la peau. Ces protubérances s'enlèvent avec la peau du poisson.

Le lymphosarcome est un virus qui afflige le maskinongé et le grand brochet. Il se transmet au moment de la fraie, mais les lésions qu'il entraîne varient avec les saisons et l'évolution de la maladie. Au printemps, les individus atteints ont d'épaisses taches blanches d'où ils éliminent le virus; ces desquamations vont infecter d'autres poissons. Plus tard dans l'année, les taches peuvent se résorber et former des lésions couperosées ou même reprendre l'apparence d'une peau normale. Le virus qui est à l'origine de la maladie infecte les globules blancs du poisson et se répand dans tout l'organisme sur une période allant d'un été à plusieurs années. Le lymphosarcome peut entraîner la mort du poisson, mais il n'existe aucune preuve que cette maladie soit dangereuse pour les humains.

On a relevé des tumeurs ressemblant à des verrues sur les lèvres et la peau de poissons communs dans certaines régions des Grands Lacs. Ces tumeurs disparaissent chez les poissons placés dans des aquariums de laboratoire et sont vite remplacées par de nouvelles excroissances, ce qui suppose une origine virale de la maladie.

Selon des études effectuées des côtés canadien et américain des Grands Lacs, ces tumeurs seraient plus fréquentes dans les secteurs pollués. Là où le niveau de pollution est particulièrement élevé, on observe aussi des tumeurs du foie et des intestins.

Les études laissent suggérer que la pollution serait directement responsable des tumeurs du foie et indirectement responsable des tumeurs cutanées. Comme l'eau est plus chaude dans les régions polluées, elle attire les poissons en plus grand nombre et augmente le risque d'infection virale.

On effectue actuellement des recherches plus poussées pour déterminer si la pollution est en cause; la plupart de ces recherches sont menées ou subventionnées par les gouvernements ontarien et canadien.

Bien qu'une infection virale ou bactérienne rende le poisson moins appétissant, elle ne présente aucun danger pour la santé humaine, à ce que l'on sache.

# Contaminants

De nombreuses substances, telles que le mercure, se trouvent naturellement dans l'air, l'eau et les aliments; à des concentrations normales, elles ne posent aucun risque pour l'environnement ou la santé humaine. Des substances synthétiques, comme les BPC, le mirex et les dioxines, sont également présentes dans le milieu.

Lorsqu'elles atteignent des concentrations supérieures aux seuils fixés par le gouvernement, on peut les qualifier de contaminants ou de polluants.

Sont décrites dans cette section une variété de substances qu'il est possible d'analyser dans le poisson gibier de l'Ontario.

Pour de plus amples renseignements sur ces substances et leur effet sur la santé, communiquer avec les responsables du Programme de surveillance de la contamination du poisson gibier.

## Substances inorganiques

### Mercure

Le mercure est un métal naturel qui se recontre à de faibles concentrations dans l'air, l'eau, les roches et le sol ainsi que dans les matières animales et végétales.

Il était naguère très utilisé dans l'industrie. Mais les mesures prises par cette dernière et le gouvernement à la fin des années 60 et au début des années 70 ont permis d'éliminer à toutes fins utiles les rejets de mercure par les principales sources industrielles. On en emploie encore de nos jours en quantités relativement petites, mais ce emploi restreint ne semble pas avoir eu de répercussions nuisibles sur l'environnement.

Le mercure se fixe aux particules en suspension dans l'eau et se dépose au fond, où il est converti en méthylmercure par des micro-organismes. Ce composé est rapidement absorbé par les poissons, soit directement avec l'eau qui traverse leur membrane branchiale ou indirectement par les organismes dont ils s'alimentent. Comme les poissons éliminent le mercure très lentement, celui-ci s'accumule graduellement pour atteindre une concentration toujours plus grande.

Les directives pour la consommation à l'intention des pêcheurs de l'Ontario sont fondées sur les indications du gouvernement fédéral, les recommandations de l'Organisation mondiale de la santé et l'expérience médicale tirée de l'étude des épidémies d'intoxication par le méthylmercure survenues au Japon et en Iraq.

### Autres métaux

On trouve parfois du cuivre, du nickel, du zinc, du cadmium, du manganèse, du chrome, de l'arsenic et du sélénium dans les tissus de poissons, mais à des concentrations telles qu'il ne s'avère pas nécessaire d'imposer des restrictions à la consommation.

En 1983, on a relevé de fortes concentrations de plomb dans des poissons pris en aval d'une usine de fabrication de plomb tétraéthyle sur le fleuve Saint-Laurent.

Or, depuis la fermeture de cette usine en 1985, la teneur en plomb a chuté au point où ce métal ne présente plus de danger de contamination.

## Substances organiques de sources industrielles

### Biphényles polychlorés (BPC)

Les BPC sont un groupe de composés organochlorés dont l'usage commercial remonte à la fin des années 20. Comme ils ne se trouvent pas dans la nature, leur présence est invariablement associée à l'activité humaine.

Les BPC ont tendance à persister dans l'environnement pendant des années et s'accumulent dans l'écosystème aquatique. Ainsi, dans certains cours d'eau de l'Ontario, des gros carnivores à tissus particulièrement adipeux, tels le saumon et la truite, ont stocké des BPC à des concentrations suffisantes pour avoir chez eux un effet contaminant.

Il est maintenant interdit d'utiliser des BPC dans la fabrication de nouveaux produits. Aujourd'hui, on les trouve uniquement dans le fluide isolant de transformateurs et condensateurs mis hors service.

L'imposition de règles rigoureuses pour l'entreposage et l'élimination des BPC et de l'équipement contaminé par des BPC a permis de limiter le rejet de ces composés dans la

nature et a contribué à en réduire la quantité dans le milieu aquatique. Les recommandations pour la consommation du poisson contaminé par les BPC se fondent sur le seuil de 2,0 parties par million établi par le gouvernement fédéral pour les poissons destinés à la vente.

### Mirex

Le mirex est un hydrocarbure chloré utilisé comme pesticide dans le sud des États-Unis, mais qui n'a jamais été enregistré à cette fin au Canada.

La présence de mirex a surtout été décelée dans des poissons du lac Ontario. Les sources : une ancienne usine de transformation de mirex de Niagara Falls (New York) et une manufacture d'Oswego (New York). Dans le milieu aquatique, le mirex se comporte comme les BPC : il persiste longtemps dans l'environnement et a une affinité marquée pour les tissus adipeux. Le présent guide suit les recommandations fédérales en ce qui concerne la consommation de poisson contenant du mirex. Le seuil établi est de 0,1 partie par million pour le poisson destiné à la vente.

## Pesticides

### DDT

Le DDT a été mis au point pendant la Deuxième Guerre mondiale. Son emploi s'est largement répandu par la suite comme insecticide à des fins agricoles et sanitaires. Le DDT, comme les BPC et le mirex, se décompose lentement dans les milieu naturel.

Cette substance se trouve à des concentrations beaucoup moindres dans la chair des poissons depuis que son emploi a été réglementé. Les concentrations actuelles ne donnent lieu à aucune restriction pour la consommation.

### Toxaphène

Le toxaphène est un insecticide extrêmement persistant dans le milieu aquatique. Il est interdit au Canada depuis 1974 et restreint aux États-Unis depuis 1982.

Il a été observé à l'occasion dans la chair de poissons de l'Ontario, mais à des concentrations trop faibles pour être dangereuses.

### Autres pesticides

Dans le cadre du Programme de surveillance de la contamination du poisson gibier, plusieurs pesticides largement utilisés en Amérique du Nord sont analysés régulièrement. Il s'agit de l'hexachlorobenzène (HCB) et de pesticides tels le lindance, l'heptachlore, l'aldrine et le chlordane.

La concentration relevée aux stations d'échantillonnage de l'Ontario n'atteint pas un niveau tel qu'il faille restreindre la consommation du poisson.

## Substances nouvelles

Le Programme de surveillance de la contamination du poisson gibier vise à contrôler le plus grand nombre de substances possible. Dès que des méthodes permettant de déceler des substances à des concentrations plus faibles sont mises au point, elles viennent s'ajouter à la batterie de tests.

Ainsi, on a adopté depuis peu de nouvelles techniques pour l'analyse d'une variété de chlorophénols, de chlorobenzènes et d'hydrocarbures polynucléaires aromatiques. On décele parfois de telles substances dans les poissons, mais à des concentrations si minimes qu'elles ne présentent aucun danger pour la santé.

Le ministère de l'Environnement met actuellement au point des moyens de mesurer de très faibles concentrations de substances de la famille des dioxines et des furannes, en vue d'en analyser les formes les plus toxiques. Quelques-uns des résultats obtenus pour la plus toxique de ces substances, la 2,3,7,8-TCDD, sont inclus dans les tableaux.

## Évolution des concentrations de polluants

La persistance des polluants dans le milieu aquatique varie d'une substance à l'autre. Leur décomposition ou transformation en substances inactives ou moins toxiques peut prendre de quelques minutes à de nombreuses années. Dans le cas de substances plus persistantes, comme les BPC, il faut recueillir et analyser des données pendant des années avant de parvenir à dégager des tendances sur leur évolution.

Les données rassemblées sur une longue période dans le cadre du Programme de surveillance de la contamination du poisson gibier sont particulièrement utiles pour déterminer l'évolution des concentrations de polluants avec le temps.

Une des tendances observées est la baisse de la concentration d'un polluant chez les poissons quand la source de pollution a été contrôlée ou éliminée.

Par exemple, le poisson du réseau English-Wabigoon a été affecté par le déversement de mercure d'une usine de chlore et de soude des environs de Dryden au cours des années 60 et au début des années 70. Des mesures de dépollution ont réussi à ramener la concentration de mercure à un niveau beacoup plus bas que celui du début des années 70. Le poisson gibier de plusieurs lacs de la région, notamment des lacs Clay, Ball et Tetu, font l'objet d'une surveillance annuelle. La chute de la concentration de mercure dans la partie comestible du doré du lac Clay, lac surveillé le plus près de la source de contamination, est illustrée à la figure 1, alors que la figure 2 montre la diminution, en 1987, de la concentration de mercure dans la chair du doré des lacs Clay, Ball et Tetu, ce dernier étant le plus éloigné de la source de contamination.

Les données receuillies dans le cadre du programme de surveillance montrent également qu'on ne trouve pas nécessairement la même concentration d'un polluant chez des spécimens d'une même espèce prélevés dans différents lacs. Deux exemples seraient la variation de la concentration de mercure chez le doré de trois réseaux naturels de l'Ontario et la variation du taux de BPC chez le saumon chinook de trois emplacements du bassin des Grands Lacs.

Le mercure est un élément naturel que l'on trouve dans la chair des poissons à l'échelle de la province. La figure 3 montre la variation des taux de mercure dans la chair du doré de trois réseaux naturels de l'Ontario (c.-à-d. des réseaux qui n'ont pas été affectés par des déversements de mercure). Les différents milieux biologiques et physiques qui existent dans les bassins expliquent cette variation.

On trouve habituellement les plus fortes concentrations de BPC dans la chair de poissons des Grands Lacs, notamment du lac Ontario. La figure 4 montre la variation des taux de BPC en fonction de la longueur du poisson pour la partie comestible du saumon chinook à quatre emplacements des Grands Lacs. Seul la saumon du lac Ontario présente une concentration supérieure au seuil de 2,0 parties par million fixé par le gouvernement fédéral pour une consommation illimitée.

**Résultats du questionnaire sur l'édition 1989 du guide**

Le ministère a envoyé un questionnaire à retourner avec 100 000 exemplaires du guide et compilé 913 réponses. Il effectue ce sondage tous les trois ans pour évaluer l'efficacité des recommandations du guide de consommation. Il cherche également à connaître les quantités consommées et à quelle fréquence, les emplacements préférés des pêcheurs, et les espèces prises et consommées. Les répondants peuvent aussi proposer d'autres lieux d'échantillonnage et faire part de leurs commentaires ou suggestions au sujet du programme et du guide.

Voici en gros les résultats qui ont été quantifiés et quelques-unes des suggestions qui ont été reçues.

1. Près de 75 % des répondants utilisent le guide depuis plusieurs années.
2. Plus de 75 % des répondants ont indiqué que leurs habitudes de pêche et de consommation de poisson gibier avaient changé après avoir consulté le guide (la majorité de ceux qui ont dit n'avoir pas changé leurs habitudes ne mangeaient pas de poisson du tout, n'en prenaient pas ou n'en mangeaient pas en assez grande quantité, pêchaient à des endroits qui ne figuraient pas dans le guide, ou prenaient surtout du poisson dont la consommation n'était pas restreinte).
3. Plus de 75 % des répondants ont indiqué que le guide correspondait à leurs besoins et comprenait tous les lieux de pêche auxquels ils s'intéressaient.
4. Près de 90 % des répondants ont lu et trouvé utile les textes qui figurent au début du guide.
5. L'endroit le plus fréquenté était le lac Ontario, tandis que le lac Simcoe et la rivière Credit c[illegible]aient le lac intérieur et la rivière les plus populaires. On trouvera au tableau 1 la liste des dix bassins les plus souvent mentionnés dans trois catégories : les dix lieux de pêche à la ligne, lacs intérieurs et rivières les plus populaires. La popularité relative de chacun y est indiquée (c.-à-d. le nombre de fois qu'ils ont été mentionnés, d'après les dix meilleurs résultats) de façon à obtenir un total de 100 %.
6. Plus de 60 % des répondants pêchaient une fois toutes les deux semaines ou davantage.
7. Le doré était le poisson gibier le plus pêché et consommé (les deux tiers des répondants qui consomment du poisson ont mangé au moins un repas de doré). D'autres espèces qui vivent en eau chaude, telles l'achigan à petite bouche, la perchaude et le brochet, étaient aussi très populaires auprès des consommateurs. Le tableau 2 donne les dix espèces les plus fréquemment pêchées et consommées et la popularité relative de chacune (comme au tableau 1).
8. Un repas de poisson gibier faisait en moyenne 272 grammes (9,6 onces). La fréquence de consommation était le plus souvent d'une fois par mois.
9. Un repas de poisson acheté consommé par les pêcheurs à la ligne faisait en moyenne 224 grammes (7,9 onces) et la fréquence de consommation était le plus souvent d'une fois par mois. Par ailleurs, les espèces marines comme l'aiglefin et la morue étaient consommées beaucoup plus fréquemment que les espèces d'eau douce.

Les répondants ont pu apporter leurs commentaires sur plusieurs questions et ont fait de nombreuses suggestions. Quelques-unes des suggestions qui avaient été faites dans les questionnaires précédents ont été incorporées à la présente édition du guide. Les membres du public sont invités à commenter plus avant.

Parmi les améliorations les plus souvent demandées, il y avait l'échantillonnage et l'analyse d'un plus grand nombre de cours d'eau et d'espèces. On suggérait aussi d'imprimer le guide sur du papier de qualité supérieure, d'employer un plus gros caractère d'impression, d'inclure des photos couleur, plus de cartes et une section sur la prise et la remise à l'eau. Toutes ces suggestions sont examinées ci-dessous.

1. **Échantillonnage d'un plus grand nombre de cours d'eau et d'espèces**

Vous trouverez à la page 4, les raisons qui ont motivé le choix des sites d'échantillonnage. Les endroits qu ont été suggérés dans le questionnaire ont été pris en note et le

ministère en tiendra compte lorsqu'il choisira de nouveaux sites.

Il n'est pas rentable ni nécessaire d'analyser toutes les espèces de poissons dans un cours d'eau. Pour en savoir plus long sur le choix des espèces à analyser, veuillez consulter la page 4.

2. **Caractère d'impression**

En 1989, nous avons eu recours à un plus petit caractère d'impression pour réduire le nombre de pages. Nous cherchions à faire peau neuve et à diminuer le coût de production du guide. En raison des nombreux commentaires que nous avons reçus, nous avons examiné les sections où il était possible d'utiliser un plus gros caractère sans trop augmenter le coût global. Dans l'édition de 1990, nous avons augmenté la grosseur des caractères pour les cours d'eau tributaires des Grands Lacs et nous étudions la possibilité de faire de même dans d'autres sections.

3. **Qualité du papier**

L'édition de 1989 avait été imprimée sur papier journal par mesure d'économie, mesure qui avait permis d'en faire un plus grand tirage. Cette année, nous avons utilisé un papier journal de qualité supérieure qui nous permet d'économiser encore sans réduire toutefois la lisibilité du guide.

4. **Photos couleur**

Le ministère des Richesses naturelles publie une affiche couleur des différentes espèces de poisson gibier de l'Ontario. Pour des raisons d'économie, nous avons décidé de nous en tenir aux illustrations en noir et blanc. Par ailleurs, il faut préciser que certaines espèces présentent des variations de couleurs d'un endroit à l'autre. Nous avons fait appel au talent de Rebecca Brebner, étudiante à l'université de Guelph, pour retoucher certains croquis.

5. **Cartes**

Les dimensions du guide nous permettent guère d'inclure des cartes à une échelle acceptable. Nous suggérons au lecteur de consulter la carte routière de l'Ontario et les cartes topographiques du gouvernement fédéral. Le lecteur sera en mesure de situer tous les cours d'eau qui figurent dans le guide en recherchant les valeurs pour la longitude et la latitude indiquées sous le nom du cours d'eau.

6. **La prise et la remise à l'eau**

Vu le grand nombre de suggestions que nous avons reçues et la popularité croissante de la pêche «pour le plaisir», nous avons ajouté une section sur la façon de prendre le poisson et de le remettre à l'eau sans l'endommager.

On peut se procurer un exemplaire des résultats du questionnaire sur l'édition de 1989 en écrivant à :

**Tableau 1**

**Popularité relative des lacs et des rivières les plus fréquentés par les pêcheurs selon l'enquête de 1989.**

| Lac / Rivière | Popularité relative (%) |
|---|---|
| a) 10 zones de pêche les plus fréquentées | |
| 1. Lac Ontario | 19,5 |
| 2. Lac Huron / Baie Georgienne | 19,3 |
| 3. Lac Érié | 13,5 |
| 4. Lac Simcoe | 10,0 |
| 5. Rivière Credit | 7,1 |
| 6. Rivière Grand | 6,9 |
| 7. Rivière Trent | 6,5 |
| 8. Lac Scugog | 6,4 |
| 9. Lac Nipissing | 5,8 |
| 10. Rivière Saugeen | 5,0 |
| | 100,0 |
| b) Lacs intérieurs | |
| 1. Lac Simcoe | 23,9 |
| 2. Lac Scugog | 15,3 |
| 3. Lac Nipissing | 13,7 |
| 4. Lac Rice | 11,7 |
| 5. Lac Buckhorn | 9,8 |
| 6. Lac Pigeon | 7,6 |
| 7. Lac Balsam | 6,3 |
| 8. Lac Sturgeon | 5,8 |
| 9. Lac Stony | 4,5 |
| 10. Lac Chemung | 1,4 |
| | 100,0 |
| c) Rivières | |
| 1. Rivière Credit | 13,6 |
| 2. Rivière Grand | 13,3 |
| 3. Rivière Trent | 12,4 |
| 4. Rivière Saugeen | 9,7 |
| 5. Rivière Ottawa | 9,5 |
| 6. Rivière Thames | 9,3 |
| 7. Rivière des Français | 8,6 |
| 8. Rivière Ganaraska | 8,3 |
| 9. Rivière Niagara | 7,7 |
| 10. Rivière Rideau | 7,6 |
| | 100,0 |

**Tableau 2**

**Popularité relative des dix espèces de poisson gibier les plus fréquemment pêchées et consommées**

| Espèces | Popularité relative (%) |
|---|---|
| 1. Doré | 18,7 |
| 2. Achigan à petit bouche | 15,9 |
| 3. Perchaude | 12,1 |
| 4. Brochet | 11,2 |
| 5. Achigan à grande bouche | 9,7 |
| 6. Truite arc-en-ciel | 9,2 |
| 7. Truite de lac | 7,8 |
| 8. Truite mouchetée | 6,1 |
| 9. Saumon chinook | 4,9 |
| 10. Saumon coho | 4,4 |
| | 100,0 |
